Staffing

Staffing

Congrats! You've successfully set up an optimal lab space for biometric testing. Now, who is going to be in charge of the research? Check out these important staffing considerations to keep in mind when staffing your lab.

Profile

Biosensor research can be made accessible to everyone. Conducting research with the iMotions platform can be seamless and smooth, as long as you and your team members are equipped with the proper training. All things considered, certain backgrounds and profiles certainly may be a better fit for certain roles in biosensor research.

Data Collector (Technician): an expert in the iMotions platform; learns in detail all of the data collection and analysis tool capabilities

- Sharp, quick learners
- Can troubleshoot and multi-task in high energy environments

Lab Manager: coordinates scheduling, recruit, lab setup, and other operational planning

- High attention to detail
- Tech-savvy
- Great organizational skills

Research Manager: point of contact with the iMotions team; in charge of the dispersion of biosensor research knowledge to the rest of their team

- Communicates with clients on study design, business questions, and goals of the research
- Oversees coordination of projects
- Often holds a senior-leaning role within the organization

After data is collected, your team will be running analyses and generating insight reports from your studies.

Analyst: in charge of running analyses and generating insight reports from studies

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

- Deep understanding of study design and iMotions' analysis and visualization capabilities
- Experience generating research insights

There are a variety of backgrounds that can be an ideal fit for the analyst role, with experience in any of the following fields: mathematics, statistics, neuroscience, marketing, psychology, or a combination of various fields. It is important to understand how to design a sound experiment with a testable hypothesis and the adequate biosensors for your research, in order to produce the most granular, sound, and useful insights possible.

The above roles may be fluid, or merged and fulfilled by the same individual, depending on training and resources within your company.

Hiring

Hiring is critical while preparing to staff your lab to run frequent biosensor research. While often it is possible to train your current employees on biosensors, some teams may opt to hire brand new employees to take on the biosensor research portion of their business or academic lab. Whether you are scoping within your own company or conducting outreach for a new hire, these guidelines can aid in your search. Click below here to download sample job postings for roles within our company.

The number of data collectors needed for a lab depends on how many stations you will have, and for how long your sessions are alloted. For example, in a study with 4 stations equipped with EEG, ET, FEA, and GSR for a longer mobile gaming experience, we would recommend more than 1 data collector. By comparison, if you are running a 15 minute static exposure for a two station setup with just EEG and ET, 1 data collector will be more than adequate. Running a pilot test is critical before launching your study, and will help you determine how many data collectors are needed. You may also decide to hire one data collector, and have this employee train others when necessary.

Turnover

Turnover is a critical occurrence to be mindful of when setting up to conduct biosensor research. In order to combat turnover, it is recommended that a senior-leaning employee is always included in biosensor training and looped into research plans for your lab. This way, knowledge is maintained in your organization and can always be effectively transferred to new employees.
