iMotions Reports

From iMotions version 9.1.1 and beyond you can access detailed HTML reports generated by the r-notebooks you have added to your signal processing workflow directly in the software.

The HTML reports contain open-source information about the algorithms that were applied to the data to extract summary metrics as well as visualizations created by the notebook.

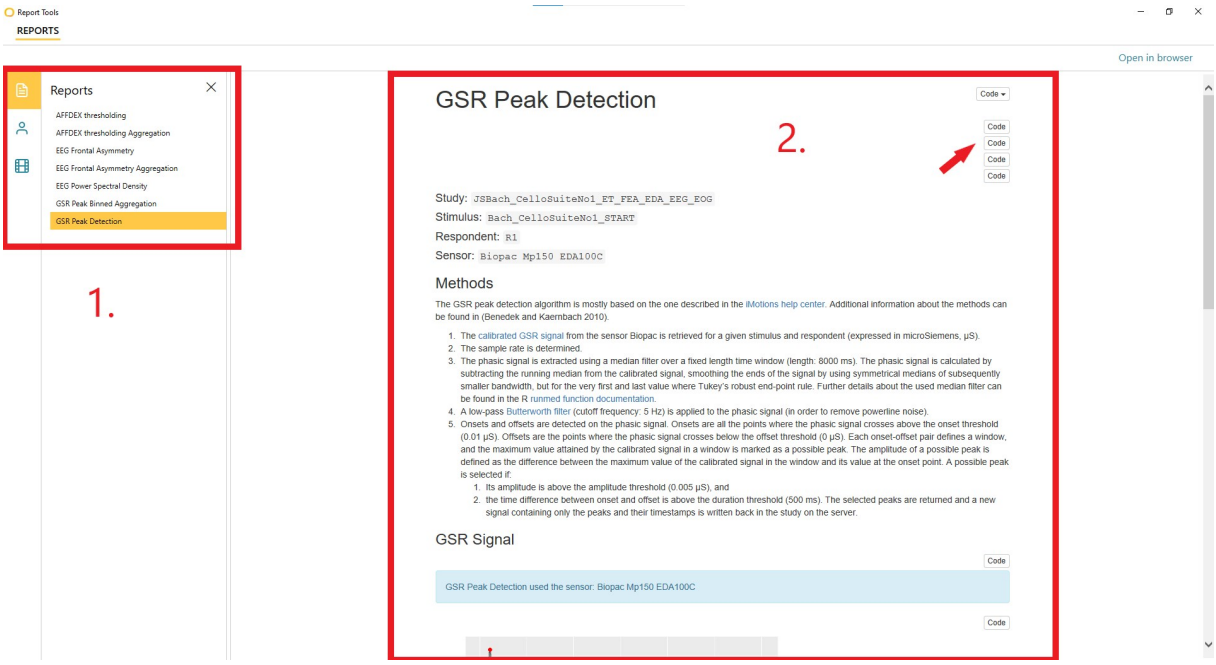

How to access the reports

The HTML reports are accessible from the analysis level. Clicking the report button.

This will open the report window that looks like this:

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

1. On the left side of the screen you will be able to select different reports depending on the different R-notebooks you have added to the analysis. You can use the respondent or stimulus icon to see the same report for different respondents or stimuli

2. In the visualization area you will see the HTML report being generated. You can expand the code areas to get details about each computational step that the notebook ran. The report also contains visualizations of the data and data tables if applicable.

Troubleshooting

- if no notebook was ever added, the report button will be greyed out
- if notebooks were added, but none was executed, the UI prompts you to execute the notebooks first
- if notebooks were added but canceled before processing was completed, you will see the reports for respondents that were processed fully, but you will get an error for those respondents/stimuli that haven't been processed yet
- if notebooks were added and run, but no data could be generated you will get an error message.
