Creating RDC Studies

This article provides instructions for creating an iMotions Remote Data Collection (RDC) study:

- Requirements for Creating an RDC Study
- Recommendations about RDC Study Design
- Creating an RDC Study in iMotions Lab
    - Selecting Sensors
    - Adding Stimuli
    - Webcam Eye Tracking Calibration
- Starting Data Collection on my.imotions.com
    - Uploading study from iMotions Lab
    - Study and stimulus settings on my.imotions.com

Requirements for Creating an RDC Study

- iMotions Lab desktop software
- iMotions Remote Data Collection module
- Internet access
- Logging in to my.imotions.com

Recommendations about RDC Study Design

To facilitate data collection, it is important to minimize demands on respondents, their computers, and their internet connections. These demands correspond with study duration, stimulus file size, and data file size. So we recommend:

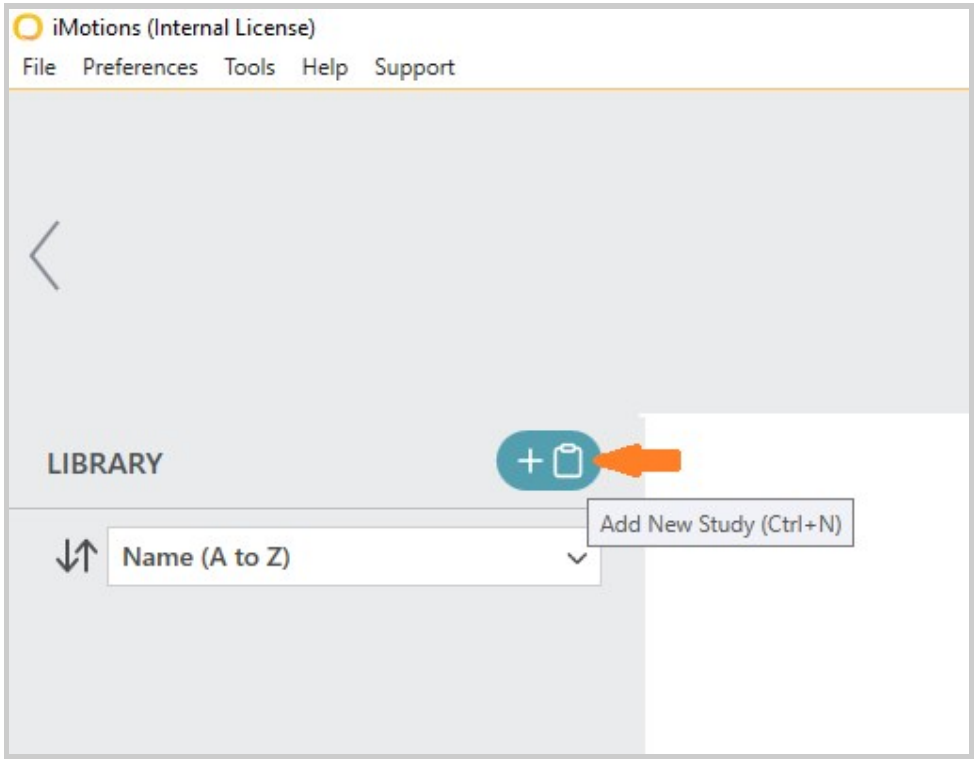

- Study duration is under 10 minutes.
- Maximum stimulus resolution is 1920x1080 pixels and 30 frames per second (for videos).
- Disable screen and/or camera recordings when not needed - in study settings on my.imotions.com.

Creating an RDC Study in iMotions Lab Software

This section provides instructions for creating an RDC study in iMotions Lab software, when a study design and stimuli are ready.

1. Click the *Add New Study* button (or press Ctrl+N) to add a new study.

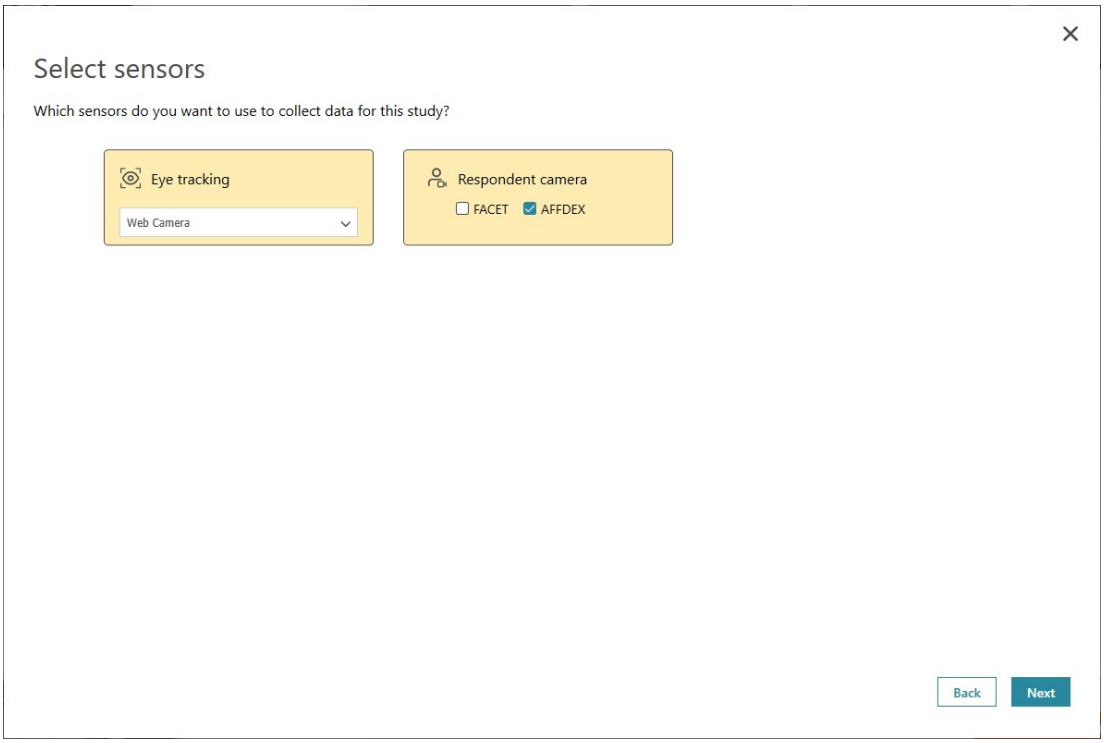

2. Select *Remote Data Collection* in the *Create a new study* window, then click *Next.*

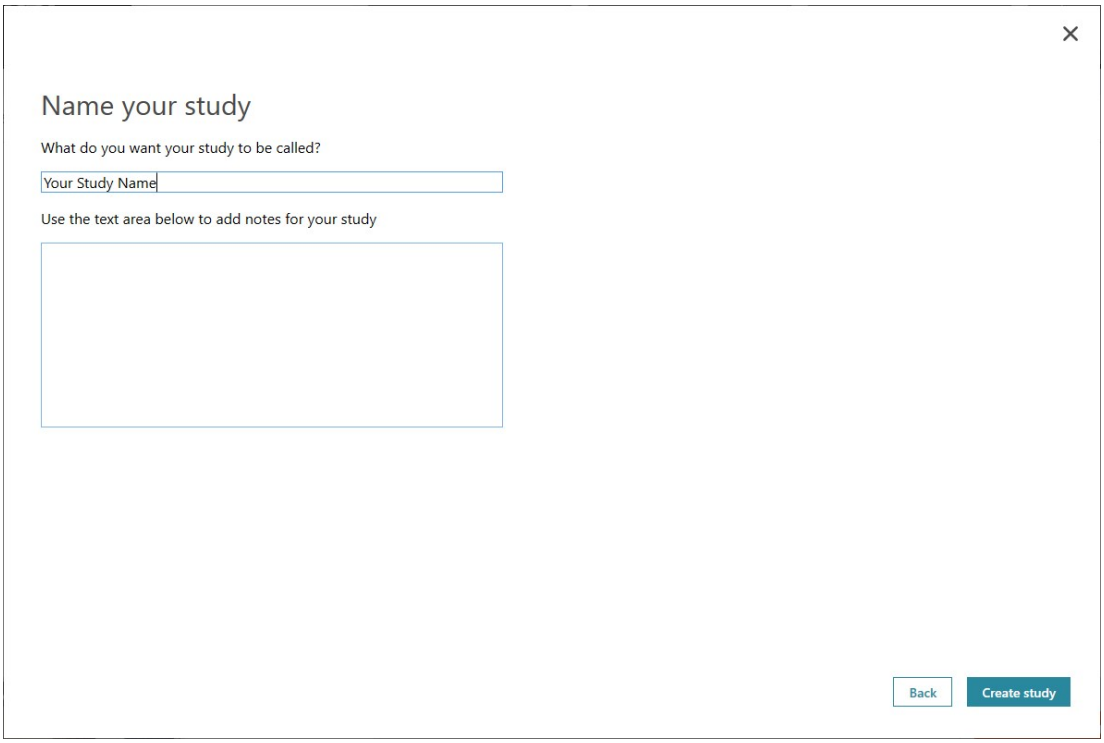

3. Select *Eye tracking* (*Web Camera*) and/or *Respondent camera* (AFFDEX or FACET) in the *Select sensors* window (highlighting them in yellow) then click *Next* - further details in Selecting Sensors section.

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

4. Enter a study name in the *Name your study* window, then click *Create study*

5. The study will be created and added to your iMotions Study Library. Study Settings and Sensors can be adjusted prior to data collection and should not be changed after data collection has started for a study (other settings may be relevant for analysis but not study setup or data collection).

Selecting Sensors

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

iMotions RDC data collection involves screen and camera recordings from the respondent computer. Sensor data for Web Camera Eye Tracking and AFFDEX or FACET Facial Expression Analysis are extracted from camera recordings. Selection of Web Camera Eye Tracking or Facial Expression Analysis requires module access.

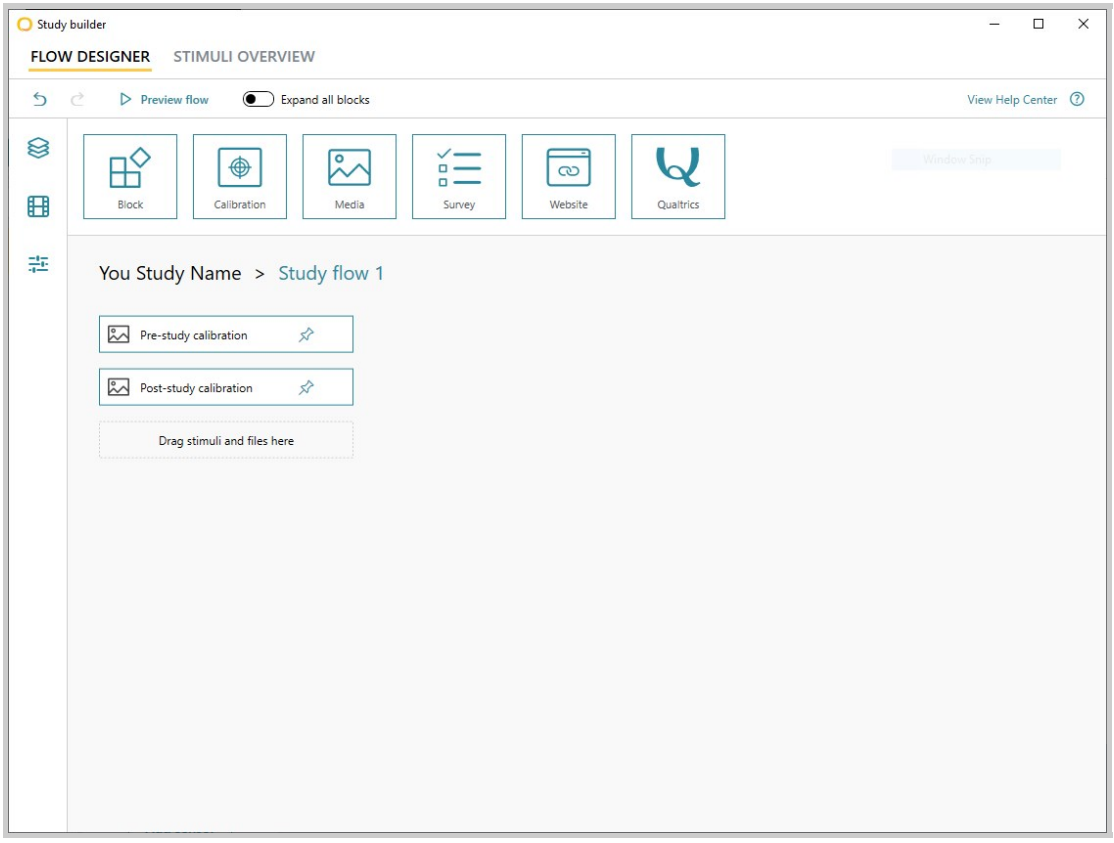

iMotions RDC Studies have two available *Sensors*:

1. Eye Tracking with a Web Camera
    - Eye Tracking requires calibration stimuli at the beginning and end of the study (automatically included in iMotions 10 or newer versions, but must be manually added in older versions)
    - Additional Eye Tracking calibration/stimuli are recommended for every 5-10 minutes of data collection
    - For iMotions 9.4 and older versions, General Settings and Study settings must include accurate display settings on the iMotions computer
2. Respondent Camera for Facial Expressions Analysis with AFFDEX or FACET
    - No additional requirements
3. Microphone recording is enabled on the study settings on my.imotions.com.

Selecting Stimuli

1. Click the *Edit stimuli* button to open the iMotions Study Builder.

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

2. Select the stimulus type to add. For RDC studies, this can include any number/combinations of Block, Calibration, Media, Survey, Website, and Qualtrics stimuli (refer to Study Builder article for more information about the Study Builder, stimulus types, and stimulus properties).

   a. Block - Each block contains other study stimuli that will be presented together (e.g. stimulus-survey pair). Setting *Display order* to *Random* will randomize the presentation order within the block.
   b. Calibration - Calibration image files for webcam eye tracking (showing calibration points)
   c. Media - Image, video, or audio files
   d. Survey - Opens *iMotions Survey Tool* to design and save a survey to the study (available in iMotions version 9.011 or newer)
   e. Website - Website address
   f. Qualtrics - Qualtrics survey website address

3. Once stimuli are added, the *Preview study* button (at the top-right of the main iMotions window) can be used to view the study as it will be seen by participants - including iMotions study screens with instructions for

participation.

4. Confirm the appearance and order of your study stimuli proceeding to data collection. Note: The study and stimuli can not be changed after data collection has started.

Webcam Eye Tracking Calibration

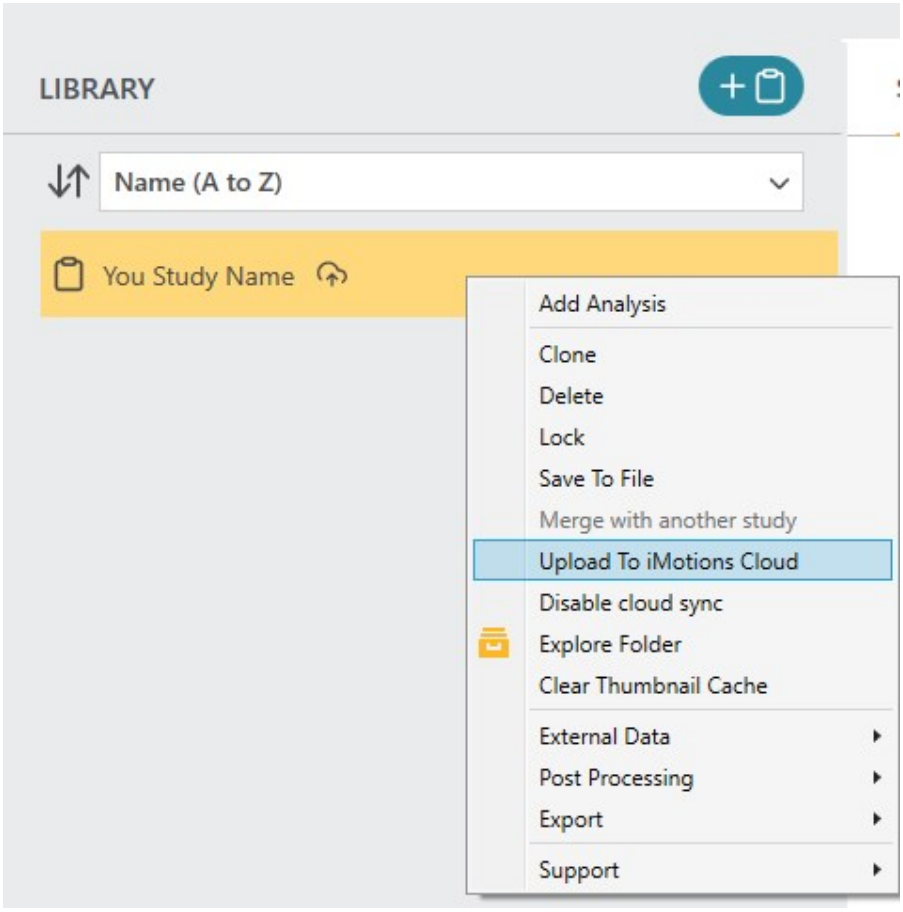

Calibration stimuli are automatically included at the beginning and end of any RDC study with eye tracking. We recommend using the default, animated calibration stimuli. Additional calibration stimuli are available in the iMotions folder (C:\Program Files\iMotions\Lab_XG\WebcamCalibrationSlideTemplates).

Starting Data Collection on my.imotions.com

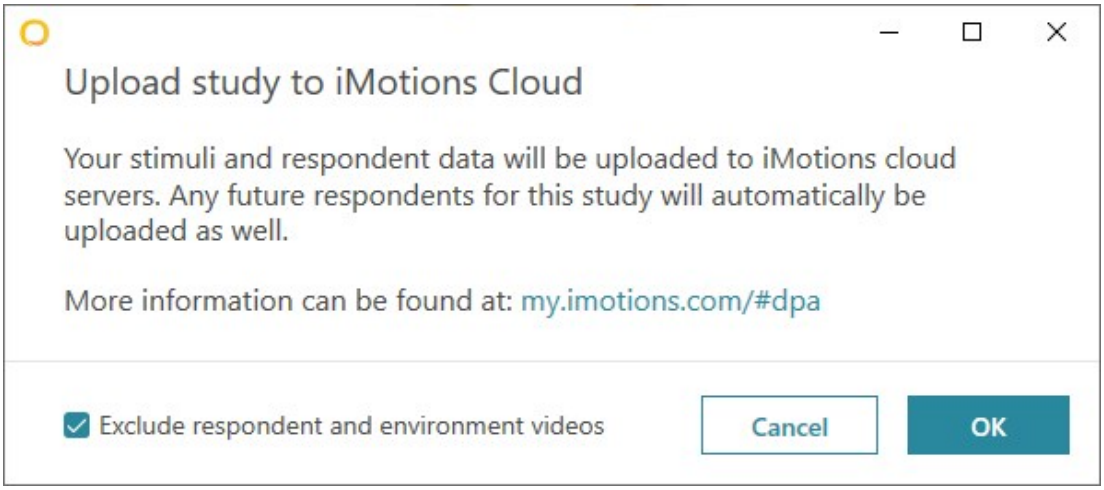

When your RDC study is ready for data collection, you can upload the study from iMotions Lab to my.imotions.com, where study settings are finalized and data collection is started.

1. In iMotions Lab, right-click on your RDC study then click *Upload to iMotions Cloud*. Note: A study can not be uploaded if there is an existing study with the same name (i.e. uploaded once). You can clone and rename the study in iMotions Lab or delete the existing study from my.imotions.com to proceed.

2. Click *OK* to confirm study upload (In case the study includes previously collected video recordings, these files can be excluded from the upload by checking the *Exclude respondent and environment videos*).

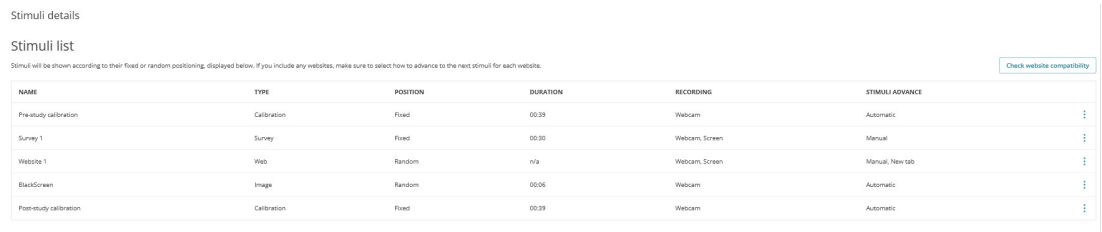

3. Log in to my.imotions.com
4. Click on your study to open the Study Overview
5. Click on *Details* to navigate to the *Data Collection* page. Confirm/adjust RDC Study Settings as needed. Descriptions of each setting are provided on this page. Note: Microphone recording is disable, by default.

6. Click on *View stimuli details* where additional process to *Check website compatibility* and adjust stimulus display properties (by clicking the three dots on the right of the page for each stimulus). We recommend disabling any recordings that are not necessary data collection.

7. Click *Start remote data collection* to enable data collection and proceed to the *Data Collection* page with your study link.
8. Copy the RDC study link to study participation, to send to respondents.

Data upload alternative

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

As with any operation on the internet, there is always the possibility that connection issues will interrupt the planned flow of information. Ticking this checkbox will provide the participant with the option to download their data, and to manually email it to the researcher. You can enter your email with which you wish to receive any manually sent study data.
