Export - iMotions Online

This article explains each of the features associated with the export page on iMotions Online.

When you first arrive on the export page, you will be presented with the page as in the image below, where the following exports are available for the study, signals, facial expressions, and visualizations (as described below):

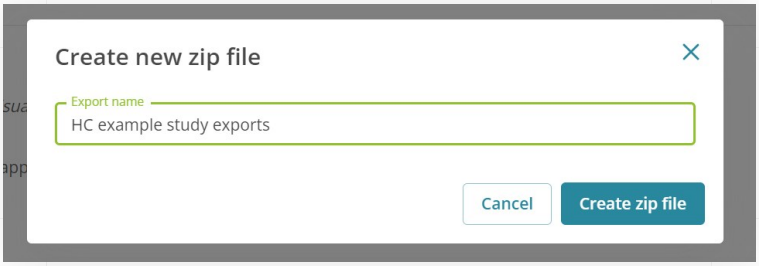

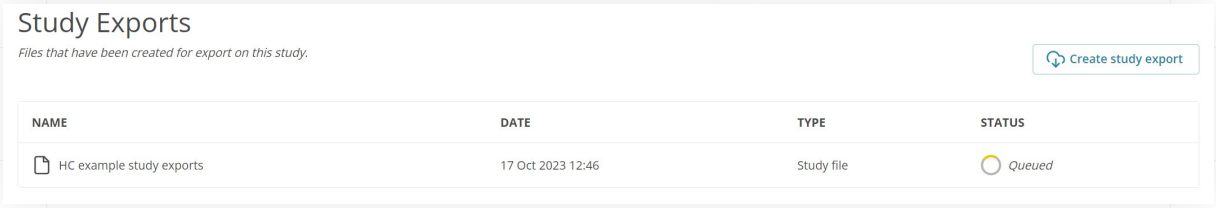

Study exports

Clicking on "Create study export" will initiate the creation of a zip file containing all of the study information. Enter a name for the export, and click on "Create zip file". Once clicked, the status will change to "Queued". Once the study export file has been processed, it can be downloaded by clicking on "Download" under the "status" column.

The study export file allows you to import the Online study into iMotions Lab. Simply open up iMotions, click "File" in the top-left corner, then select "Load study from file". A pop-up box will appear. Click "browse" and locate the study export folder (this should be kept as a zip file, there is no need to extract the files). Once this has been selected, click on "import" and the study will be loaded into iMotions. Please note that iMotions Lab currently only supports the stimuli types that are common to both Online and Lab (i.e. videos, images, web recordings, and Qualtrics surveys) - other stimuli types (such as the calibration slides, the Online survey, and instruction slides) can be imported, but it's not possible do anything with them.

Signal exports

Clicking on "Create signal export" will initiate the creation of a zip file containing sensor data files. Enter a name for the export, and click on "create zip file". Once clicked, the status will change to "queued". Once the signal export file has been processed, it can be downloaded by clicking on "Download".

The folder contains CSV files for each participant (unless the alternate export format is selected). A screenshot of an example file is shown below. Rows 1-18 contain information about the data that is presented in the columns below. The data is timestamped in milliseconds. You can scroll to the right to find the columns associated with facial expression analysis and eye-tracking data. The data is found below each of these.

Facial Expressions export

Clicking on "Create AFFDEX export" will initiate the creation of a "AFFDEX_Raw_Data_Statistics.csv" file (unless the alternate format is selected). Once clicked, the status will change to "queued". Once the signal export file has been processed, it can be downloaded by clicking on "Download".

This file will contain descriptive statistics (mean, standard deviation, and variance) for each respondent, stimulus (Label), and Affdex metric:

AFFDEX_Raw_Data_Statistics

Ready

Visualizations

Visualizations must first be initiated from within the analysis page (more information available here). Visualizations are only available for image or video stimuli, with either the gaze path (for individual participant analyses), heatmap (for aggregate analyses), or the signal overlay enabled. Once you have clicked on "create visualization report" from the analysis page, you will see the file(s) as below on the export page:

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

The encircled "i" symbol provides a quick overview of the visualization, including the stimulus type and name, the participant ID or grouping, and the type of visualization (e.g. heatmap). The file can be downloaded by clicking on "download", which appears once the processing is complete.
