Facebox for Facial Expression Analysis

In some scenarios, users have a video they wish to process with our Affdex facial expression module. This video, however, contains more than one faces or a face in the corner of the screen.

Note: this feature does not work with Emotient FACET.

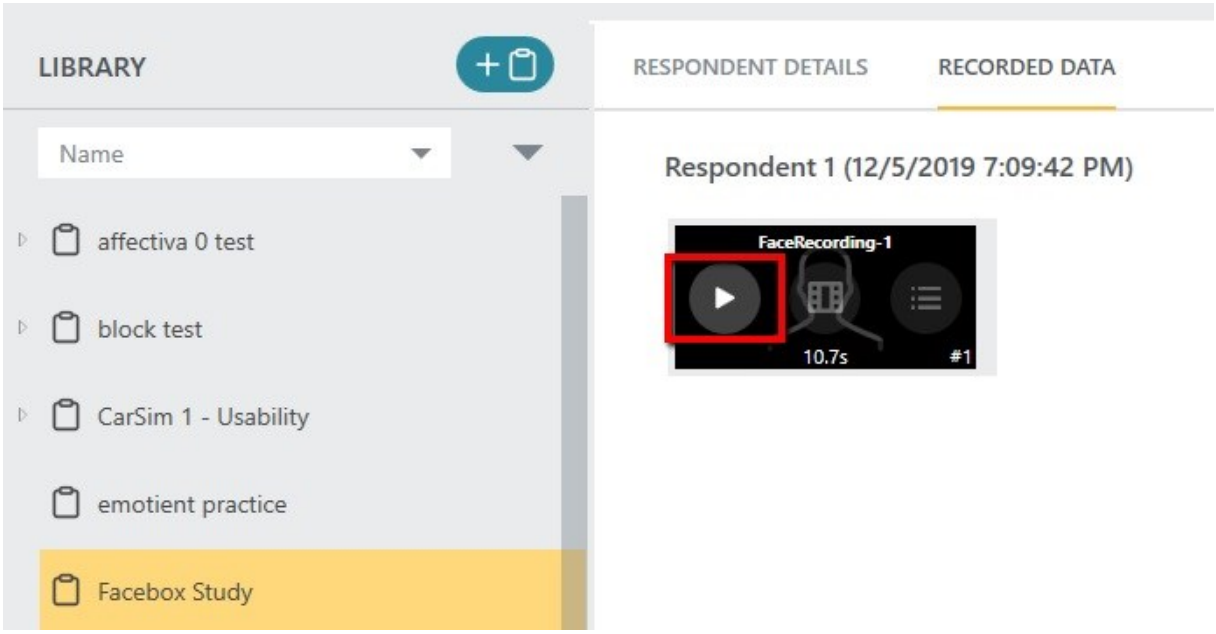

Example:

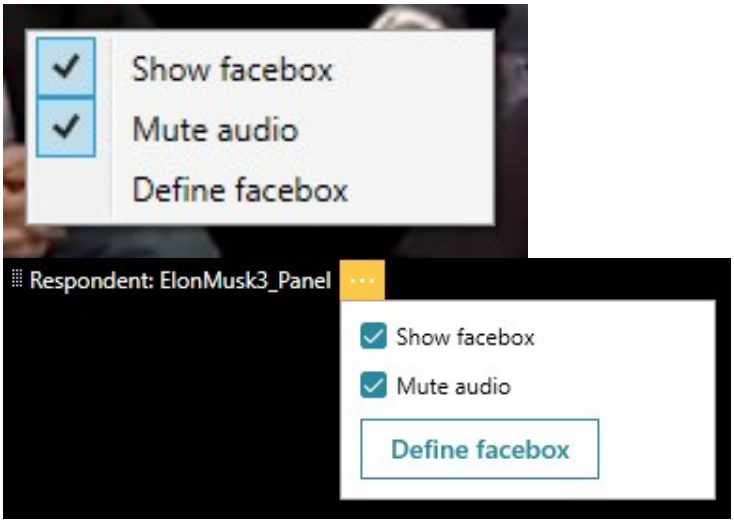

How to use

1. Once you have uploaded a video for post-processing (see full guide, HERE), you can open the video replay:

2. Once you are in the video replay, select the "Define facebox" option by right-clicking on the respondent video or by clicking on the three dots "..." behind the name of the video:

3. This opens the editor, where you can place the facebox around the face you wish to analyze. This will define the area in which the face detection algorithm is going to search for a face. Please note that you should make the facebox larger if you know that the person is going to move. This is because the location that you manually define will remain constant throughout the video.

6. Once you set the correct area, you can then select on of the following options:

Definitions for each option

Delete facebox

If there is a set facebox already, it deletes it.

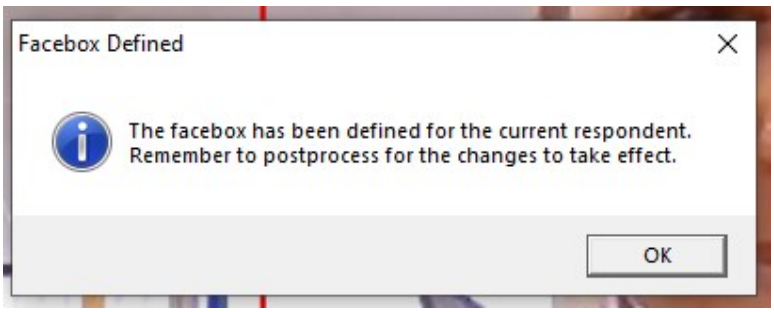

Use for all respondents

If you have a number of videos and the respondent face is on the same position on the video, you can set the position for all videos in that same study.

Use for this respondent

If you have one video only or videos with respondent faces in different positions of the video frame, you can set the box for the current respondent.

Once you have set the box you will receive a confirmation message:

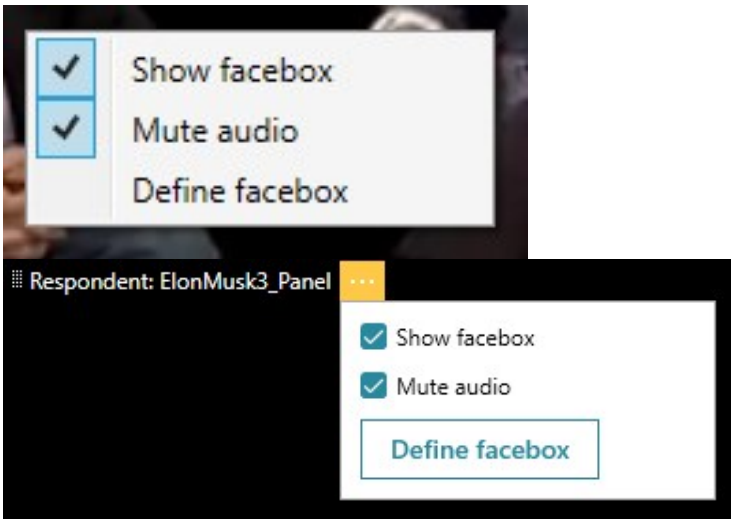

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

As the above message mentions, this only defines the area where the processing will take place. However, you will still have to run the post process.

How to show and hide facebox in replay and export

You can choose to show or hide the facebox in the replay by selecting or deselecting the "Show facebox" option.

This selection will be carried over in case you export a video or image of your replay.
