R Processed EEG Export Files

This article explains how to export the EEG Frontal Asymmetry and EEG Power Spectral Density Summary Metrics files (which is available as soon as the R Notebook for Frontal Asymmetry or Power Spectral Density has been executed). Hereafter, the article discusses in further detail what is presented in these two export files.

This Help Center article will guide you through:

- *What is the EEG Frontal Asymmetry and Power Spectral Density Metrics export file?*
- *How to export the EEG Frontal Asymmetry or Power Spectral Density Metrics export-file?*
- *The EEG Frontal Asymmetry Metrics export-file explained*
- *The EEG Power Spectral Density Metrics export-file explained*

What is the EEG Frontal Asymmetry and Power Spectral Density Summary Metrics export file?

The EEG Frontal Asymmetry Summary Metrics export file is produced by the *EEG Frontal Asymmetry R Notebook*. The EEG Power Spectral Density Summary Metrics export file is produced by the *EEG Power Spectral Density R Notebook*.

Note that the export file is therefore only available as soon as its corresponding R Notebook has been executed.

The exporting further produces an export file, which, for *every* respondent included in the analysis and for *every* stimulus, scene, or annotation present in the study, computes the mean FA (for R Notebook Frontal Asymmetry) or mean PSD (for R Notebook Power Spectral Density)

If you are unsure about what “R Notebooks” are, please click *here*.

If you want to read more about the R Notebook for Frontal Asymmetry, click *here*.

If you want to read more about the R Notebook for Power Spectral Density, click *here*.

How to export the EEG Frontal Asymmetry or Power Spectral Density Summary Metrics export file?

The EEG Frontal Asymmetry Metrics export-file or Power Spectral Density Summary Metrics expor can be obtained by following the steps shown below:

1. Select the analysis under the study
2. Select export
3. Select R Processing
4. Select the desired metrics export file
5. Select Export files

NOTE: If you want to export single multi-modal export select the option before exporting

The EEG Frontal Asymmetry Summary Metrics export file explained

The EEG Metrics export-file provides a summary table containing the (individual) FA values for all respondents included in a given analysis. Every row in the data-file represent a given respondents' mean FA within a given time-window of interest: this time-window is either the duration of a stimulus, of a scene created from the original stimulus, or of an annotation(s) placed within a stimulus.

Header	Explanation
Study Name	The name of the study

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

Respondent Name	The name of the respondent
Gender	The gender of the respondent
Age	The age of the respondent
Group	The group variables of the respondent you specified when creating the study
Type	Type of the stimulus from which the mean FA was calculated: Stimulus, Scene, Scene (Fragment), Annotation, Annotation (Instance)
Label	The given name of thestimulus, scene and annotation
Start (ms)	The start time (in ms) of the certain stimulus type relative to the start of the study
Duration (ms)	The duration (in ms) of the certain stimulus type
Parent Stimulus	The name of the stimulus where the scene was created from; the name of the stimulus/scene where the annotation was created from
Mean Frontal Asymmetry Delta*	The mean FA in Delta value for a given respondent (Respondent Name) within a given time-window (i.e., Stimulus / Scene / Annotation)
Mean Frontal Asymmetry Theta*	The mean FA in Theta value for a given respondent (Respondent Name) within a given time-window (i.e., Stimulus / Scene / Annotation)
Mean Frontal Asymmetry Alpha*	The mean FA in Alpha value for a given respondent (Respondent Name) within a given time-window (i.e., Stimulus / Scene / Annotation)
Mean Frontal Asymmetry Beta*	The mean FA in Beta value for a given respondent (Respondent Name) within a given time-window (i.e., Stimulus / Scene / Annotation)
Mean Frontal Asymmetry Gamma*	The mean FA in Gamma value for a given respondent (Respondent Name) within a given time-window (i.e., Stimulus / Scene / Annotation)
Algorithm Device Name	Frontal Asymmetry (*your given device's name is shown here*)

* Will only be computed and displayed in the export file if being selected when adding the R Notebook

The EEG Power Spectral Density Summary Metrics export file explained

The EEG Metrics export-file provides a summary table containing the (individual) PSD values for all respondents included in a given analysis. Every row in the data-file represent a given respondents' mean PSD within a given time-window of interest; this time-window is either the duration of a stimulus, of a scene created from the original stimulus, or of an annotation(s) placed within a stimulus.
