RDC Testing With Websites

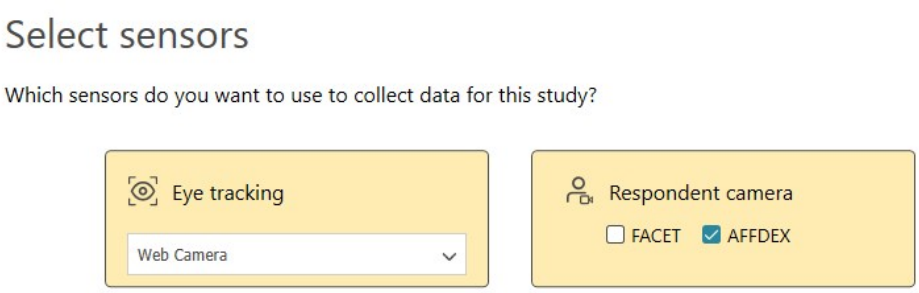

This article walks through adding website stimuli to an iMotions remote data collection (RDC) study

Creating a new study

1. To add a new RDC study, navigate to your iMotions desktop software and hit the blue clipboard button next to "Library" (or press CTRL+N). Once you have done this, the following dialog will appear. Select remote data collection and click next.

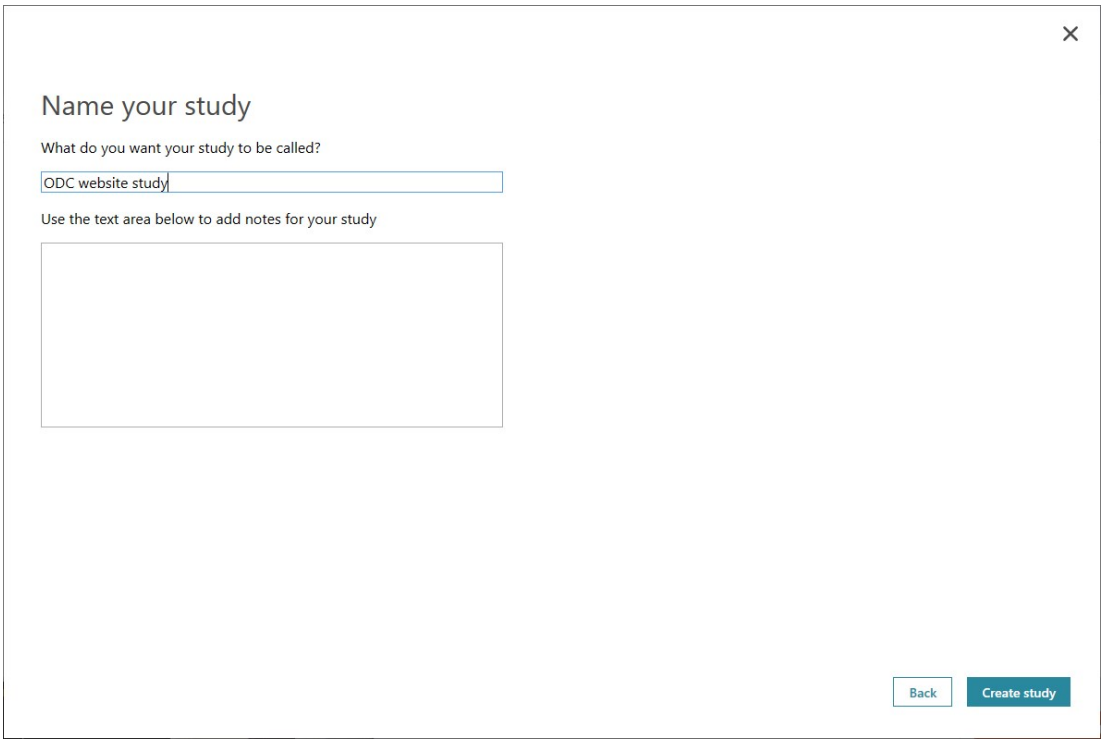

2. Select the sensors for the study - Eye tracking and/or Respondent camera

3. On the next window, give your study a name and add any notes or descriptions. Click "Next" to finish creating the study.

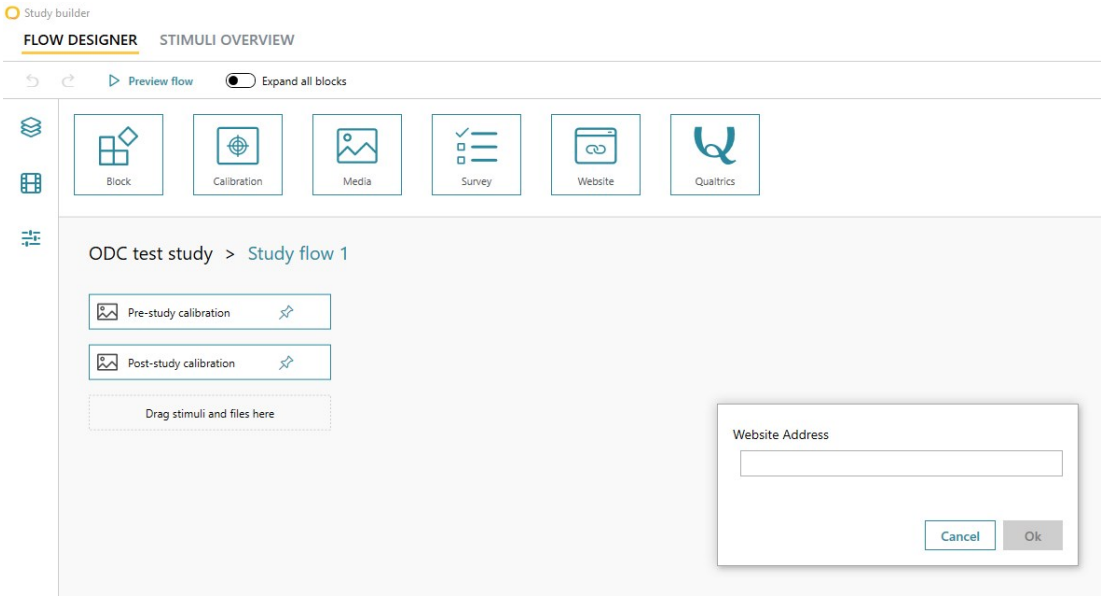

Adding website stimuli to your study

1. Click the "Edit stimuli" button to begin adding stimuli to the study

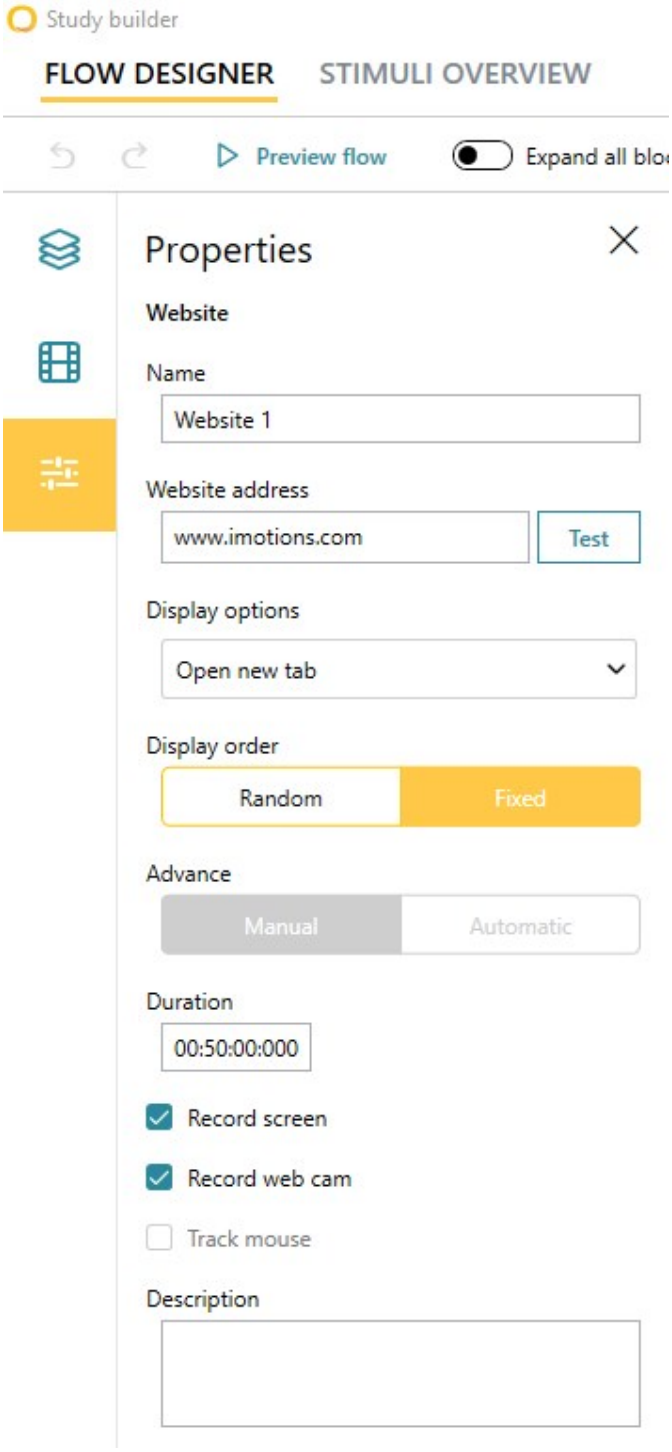

2. Click "Website" and enter the URL for the website stimulus

3. Website stimuli can be tested and edited from the Study Builder interface

or from my.imotions.com (once the study has been uploaded).

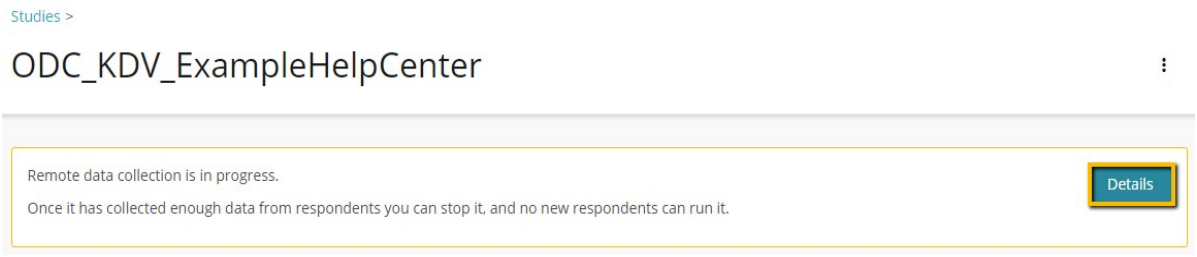

Checking website compatibility

For all websites that you test using RDC, you will need to check whether the website can be displayed as a "*new tab*" or embedded into an exiting iFrame. A new tab means that the website will open in a new tab and therefore your respondents will need to return to the tab where the RDC study was shown originally, in order to continue the study. The advantage of using the "Embed in iFrame" option is that the website will show in the original RDC tab. Unfortunately, not all websites allow for this. Therefore you will need to test this, before uploading the study. This setting can also be changed once the study is uploaded (see below). We however recommend that you test this, before uploading the study. Please be aware that the "Test" button will not reveal if the website can be used within an iFrame or not. It will only check that the URL is valid. Testing can be done using the preview study option in the top right corner of the software, once the study has been built.

Changing the display option for websites after the study has been uploaded to my.iMotions.com

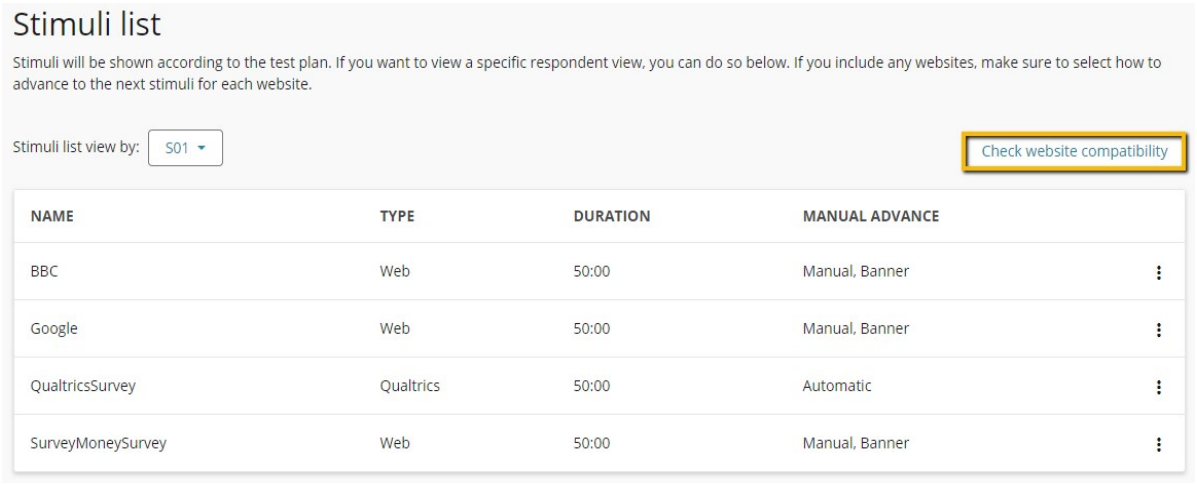

2. Go to *View stimuli details*

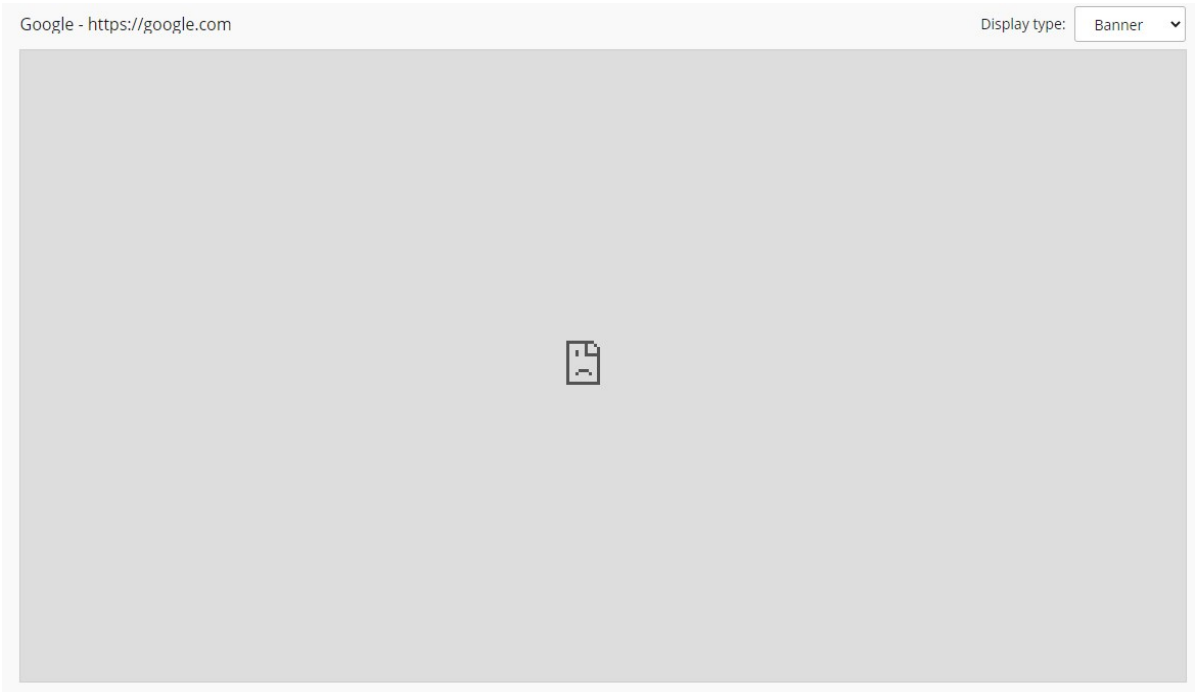

NOTE: If you have already begun data collection, please select *Stop data collection* in order to see the *View stimuli details* button.

3. Go to *Check website compatibility*

If a website is incompatible with opening in a “Banner” (iFrame) style, you will see the following image. If this is the case, you will need to select “New tab” if you want to continue testing the website.

If a website is compatible with opening in a “Banner” style, you will see it load normally like the image below. In this scenario, you do not need to select “New tab” unless you specifically want participants to open a new tab to interact with the website during the study experience.

Alternative way to set “Banner” or “New tab”

As demonstrated above, you can define whether a website will open in a “Banner” or “New tab” while checking for their compatibility. However, there is an alternative place in the experimenter dashboard to change this setting (i.e., if you already know you prefer "New tab" over "Banner").

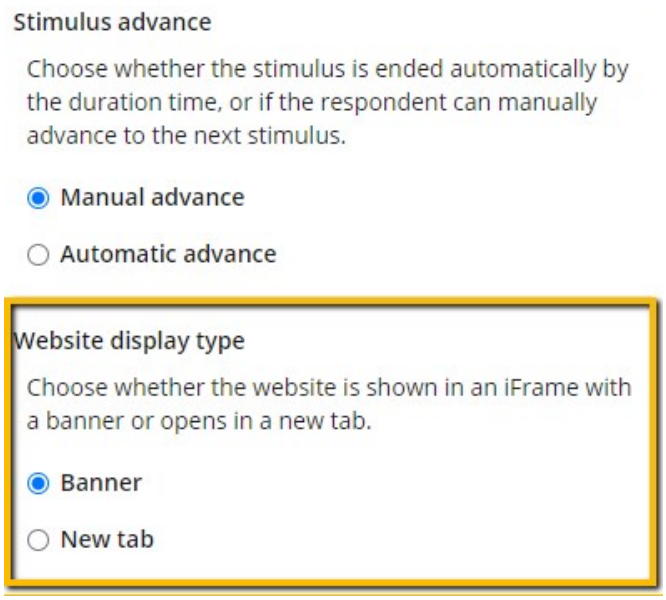

1. Follow steps 1 & 2 from above.

2. Select the three dots next to each web stimulus to set opening behavior.

3. A new popper will appear where you can select "Banner" or "New tab".

Transitioning between iMotions RDC and external websites

If you have set your website stimulus to open as a "Banner", then you must do the following steps in order to have your participant return to iMotions RDC to continue with your study after they have completed their task on the external website. This is the same requirement for Qualtrics surveys, as well. For more information on integrating Qualtrics into your RDC study, please refer to RDC Integrating Qualtrics Survey.

If you have the capability to redirect the participant to a specific link post website interaction:

Please redirect them to: https://endstimulus.imotions.com. This ensures a seamless transition between your website stimulus and the remainder of your online study flow.

If you do not have the capability to redirect the participant to a specific link post website interaction:

Please consider setting your website stimulus to open as "New tab" and/or set your advancement setting to "manual advance". Either option will ensure that the participant has a way to continue with the remainder of the study without prematurely dropping out of the online study altogether.

Related help articles to consider

1. If you are testing websites in your study, participants will be asked to

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

share the screen of their browser in order for their interaction with the websites to be recorded during the study (for playback purposes). To see what these permissions are, please refer to RDC Participant Experience Prior to Starting.

2. For detailed information on manual versus automatic advance for website stimuli, please refer to RDC Settings and Stimuli Behavior.
3. (Advanced features) For detailed information on how to utilize HTTP GET method to allow for cross-communication between iMotions and external websites, please refer to RDC Cross Communication with Other Websites.
