RDC Testing with Images and Videos

Testing with images and videos using iMotions RDC can be quickly and easily set up using instructions provided in this help center article if you only require a sequential presentation or a simple randomization of your image and video stimuli. For advanced requirements for randomization of your image and video stimuli, please refer to the RDC Using Test Plans article for more information. If you also want to include websites into your RDC study, you can also refer to the RDC Testing With Websites article.

As a reference, recommended formats for your files are:

- Images should be in .jpg or .png format.
- Videos should be in .mp4 format.

Note:

- To test if an mp4 video will play in the browser, drag it into the browser and see if it plays.

- Video filenames must end with ".wmv" or ".mp4".

- wmv files will be transcoded on the backend to a format that can play in the browser.

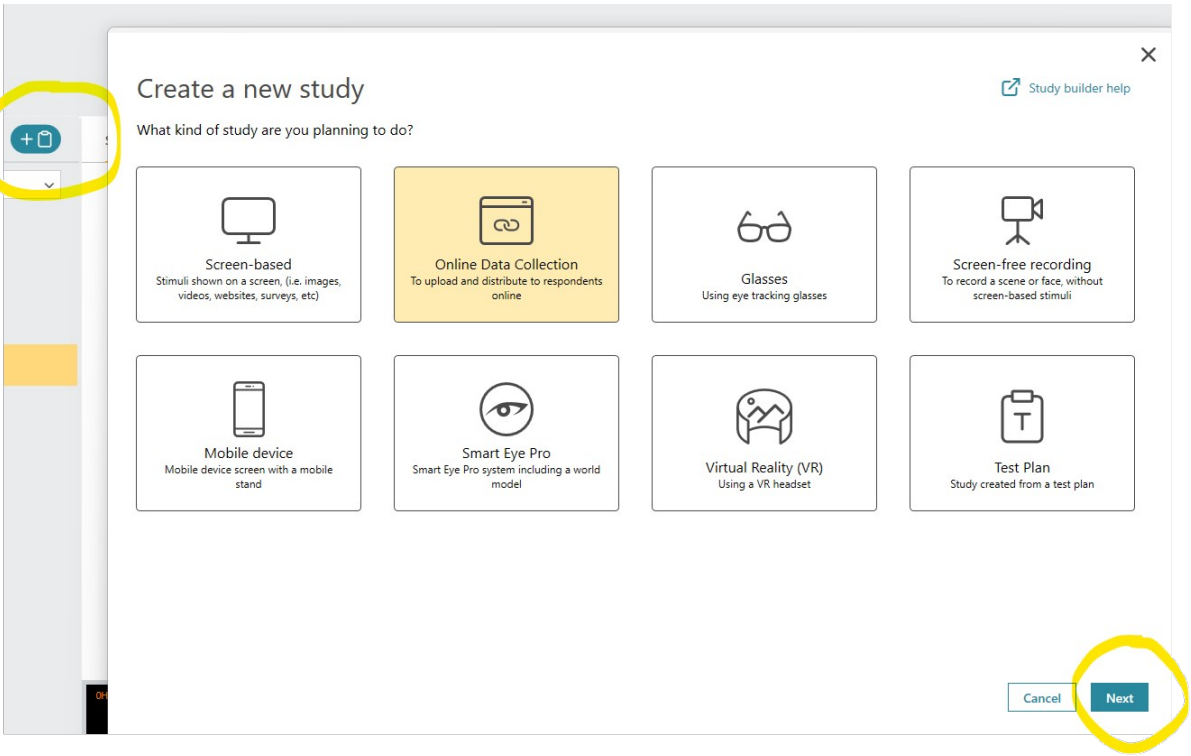

- In some cases in which .mp4 files won't play in the browser, it may work to rename the file ".wmv" to force a conversion to a playable format.

- Transcoding may take some time depending on the size and duration of the video.

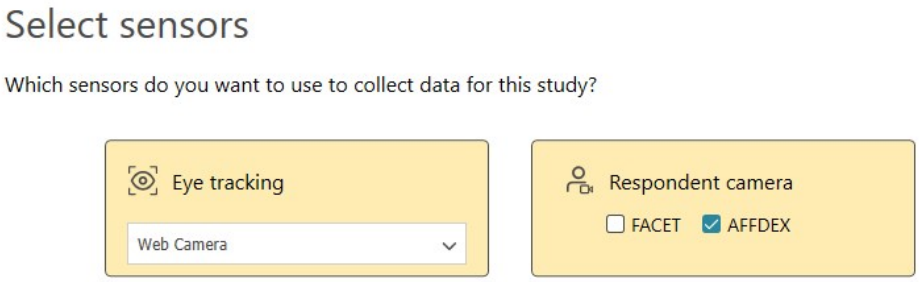

Creating a new study

To add a new RDC study, navigate to your iMotions desktop software and hit the blue clipboard button next to "Library" (or press CTRL+N). Once you have done this, the following dialog will appear. Select remote data collection and click next (note that in the below image, "remote data collection" is referred to by the deprecated language of "Online Data Collection") .

Select the sensors you want to include in the study - eye-tracking and facial expression analysis

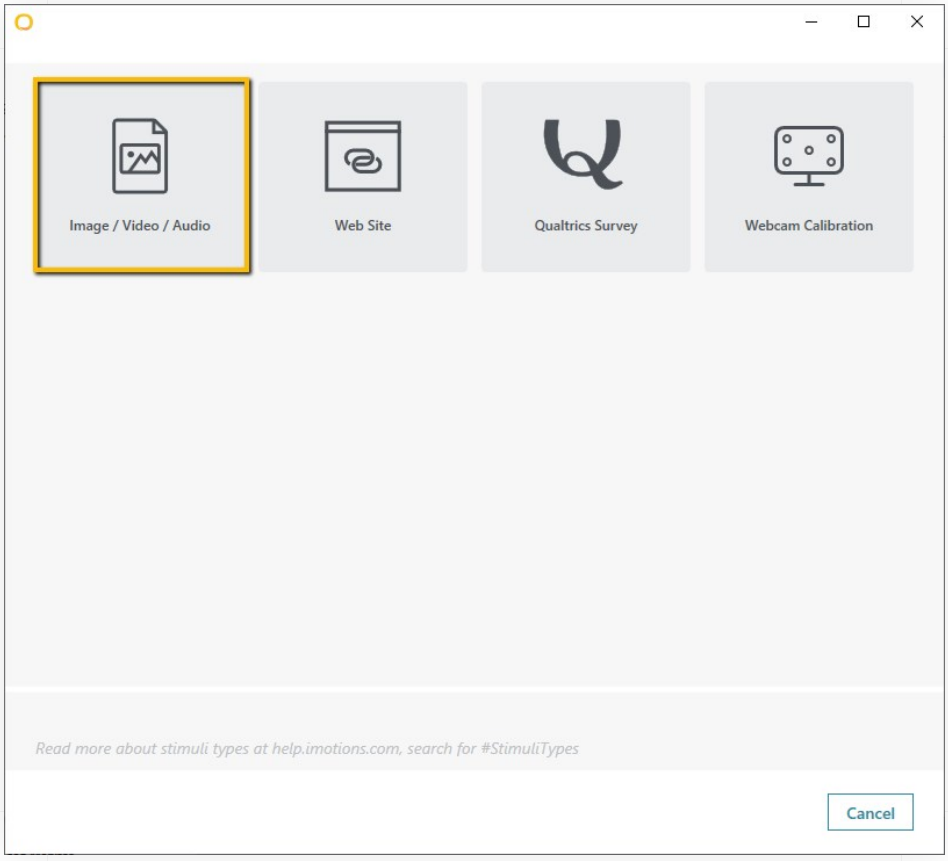

On the next window, give your study a name and add any notes or descriptions. Click next.

Adding images and videos to your study

To add stimuli to your new study, hit  and the following dialog will appear:

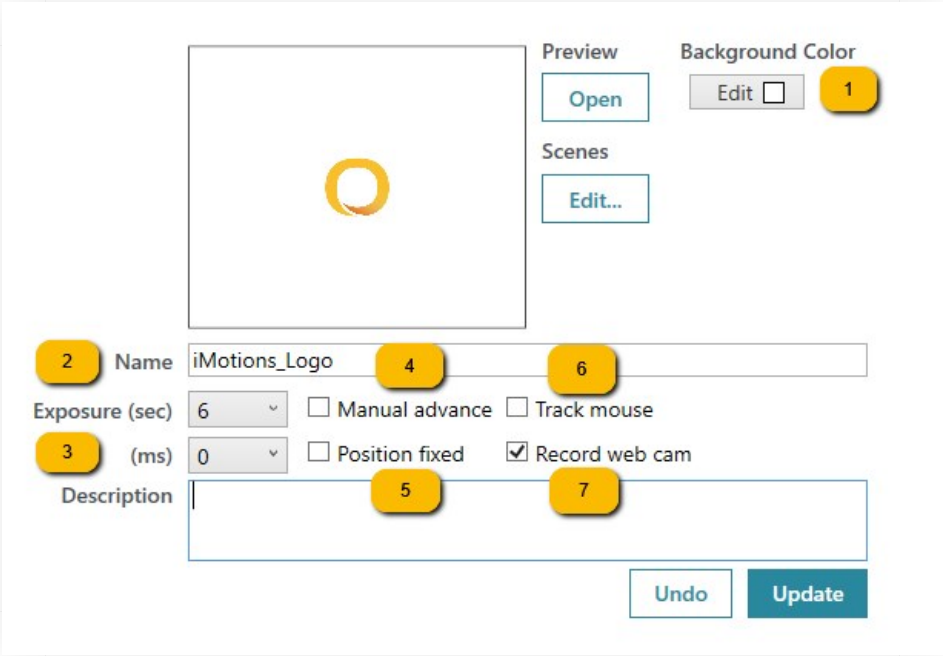

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

Selecting "Image / Video / Audio" will open a file finder dialog for you to navigate to your stimuli to add them.

Don't forget to add webcam calibration at the start and end of the study. This stimulus type will turn into a video with 13 dots when uploaded.

Image details

1. Background color that will fill the screen when the image is presented.
2. Name of your image stimulus.
3. (Maximum) exposure time for your image. Max duration is 300 seconds (5 minutes).
4. If "manual advance" is selected, then participants will have a chance to skip a given image stimulus by clicking "Skip" as shown below.

   

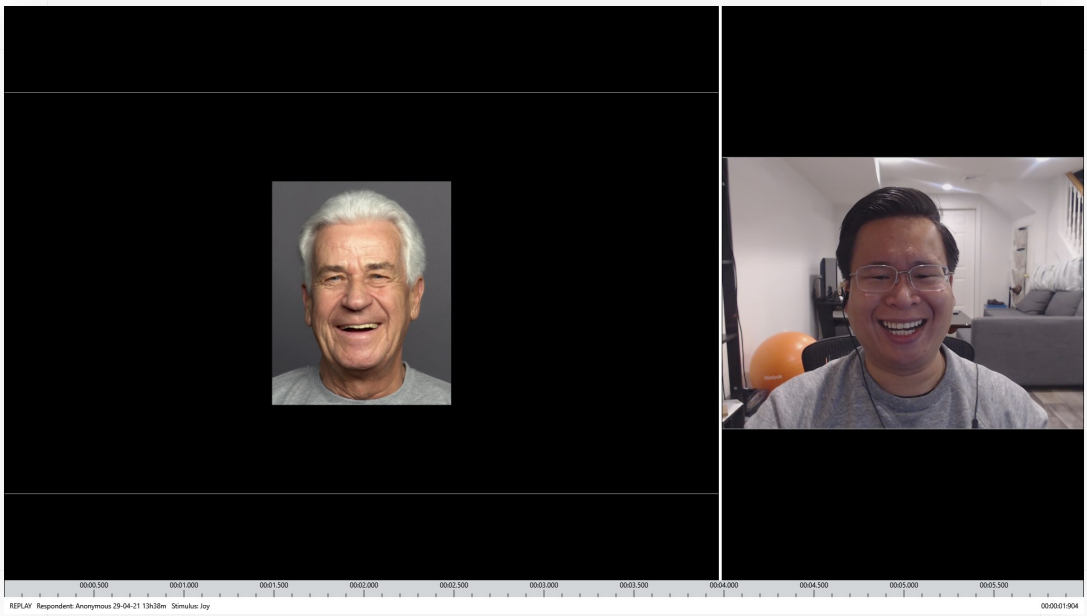

5. If you do not want to randomize the presentation order of the image stimulus, then select "position fixed" to anchor its position.
6. Mouse tracking is available for image stimuli using RDC. If activated, then participants will be able to see their cursor when interacting with the image stimulus during the study. All mouse movements, in addition to clicks, will be recorded during this interaction. Mouse tracking data can be accessed via data export. Below is an example of finding Waldo in the scene using a mouse.

7. If you do not want to record the participant's webcam during their interaction with any given image stimulus, you can deselect this option. Below is an example playback of a participant's webcam recording while they interact with an image stimulus. Note: for webcam eye tracking calibration images, this option *must* be activated.

Video details

Video details are very similar to those of image details. However, you cannot define the background color for videos, change the exposure time, or do mouse tracking.
