Respondent Camera/Video Analysis Troubleshooting

This guide provides troubleshooting recommendations for analysis of Respondent Camera videos or audio - including Facial Expression Analysis (FEA) with with Affectiva AFFDEX, Voice Analysis (VA) with Audeering, and Speech-to-Text with AssemblyAI.

General Recommendation: For custom Windows Environments (e.g. setup by computer administrator, IT department, etc.), Windows Administrator may be required to apply our Windows Settings Recommendations and provide iMotions with access to files, devices, and software that are in use. This includes error messages indicating ‘access denied’, ‘file not found’, or similar statements (as opposed to ‘Invalid file’ errors, that may be resolved with the following recommendations).

Video Import Troubleshooting

For issues occurring when Importing Videos for Facial Expression Analysis Post-Processing, Voice Analysis, or Speech-to-Text:

1. Confirm that the Import Folder (‘Study data folder’) contains video files that are accessible to iMotions (e.g. not restricted by Windows Firewall, file permissions, etc.).
2. Confirm that video files appear as expected in Windows Media Player (or other software).
3. Confirm that videos were created with standard methods (video editing or custom recording devices can cause incompatibilities).
4. If issue still occurs, use the iMotions Support button to send diagnostic files and description of the issue (we will likely request the video file where the issue occurs).

General Post-Process Troubleshooting

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

- If the Post-Processing options are not available (i.e. grayed out) but are expected for your iMotions license - please use the iMotions Support button to send diagnostic files, including license details that are needed to resolve the issue.
- Otherwise, please confirm that 'best practices' have been followed for analyzed video or audio:
    - Best Practices for Affdex Processing (Facial Expression Analysis)
    - Best Practices for Voice Analysis (and Speech-to-Text)

Facial Expression Analysis Troubleshooting

Post-Processing

For issues involving Facial Expression Analysis Post-Processing - including processing errors windows/message or when processing does not provide the expected Signals in iMotions Replays.

1. Confirm that faces appear with sufficient video quality and lighting, contrast, etc.
2. Confirm that Facebox includes the area where the face appears throughout the video in the Replay window.
3. Confirm that videos were recorded/created with standard methods (video editing or custom recording devices can cause incompatibilities).
4. Re-run post-processing with 'Ignore previous AFFDEX processed data' checked.
5. If issue still occurs, use the iMotions Support button to send diagnostic files and description of the issue (we will likely request the video file or study file where the issue occurs).

Export

For issues involving Export: Signal Processed Data - including when error windows/messages appears, files are not created, or files do not contain expected results.

1. Confirm Signal Processing is setup for the expected exports: FEA Thresholding and FEA thresholding Aggregation.
2. Confirm that Analysis Replay contain expected Signals: 'FEA thresholding' in Signal Menu and Panel.

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

3. If applicable, confirm that Aggregate Replay also contains expected Signals: ‘FEA thresholding Aggregation’ in Signal Menu and Panel.
4. If issue persists: Re-run post-processing with ‘Ignore previous AFFDEX processed data’ checked and Signal Processing (by right-clicking on the Analysis and selecting ‘Recalculate’).
5. If issue still occurs, use the iMotions Support button to send diagnostic files and description of the issue (we will likely request the study file where the issue occurs).
