Survey results - iMotions Online

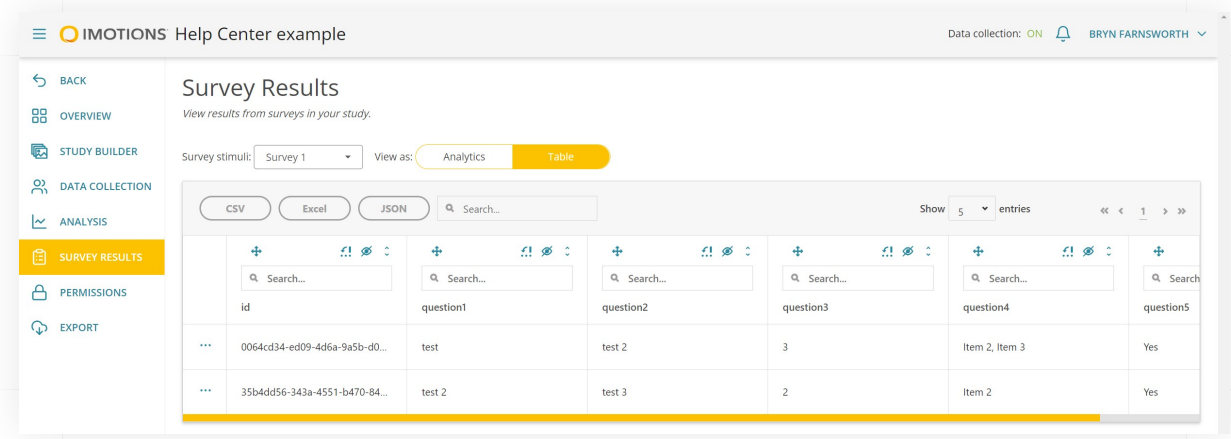

This article explains each of the features associated with the survey results page on iMotions Online.

When you first enter the survey results page, you will see something similar to the image below:

If you have multiple surveys in your study, you can change which one appears in the visualization by clicking on the dropdown box next to "survey stimuli" and selecting, by name, the survey of your choosing.

The image above shows the survey results in the "analytics" mode - this can be changed by selecting "table" whereupon you will be presented with information similar to the image below.

Below, we will first introduce the features of the Analytics screen, followed by the Table screen.

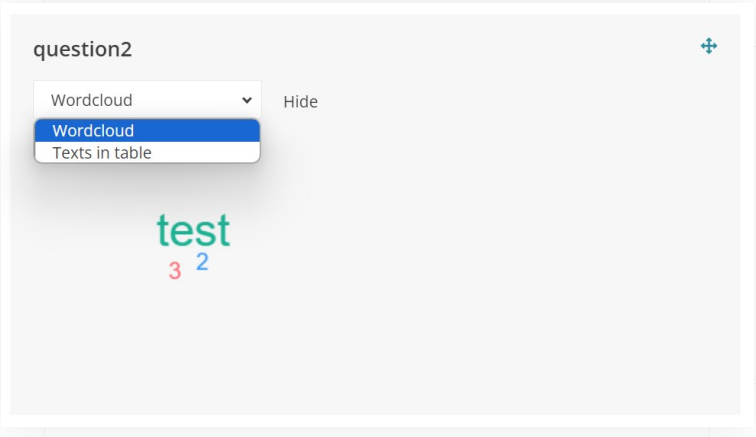

Analytics

The survey results are presented in different ways depending on the survey question type (results from a rating question will be presented differently from those from a text box question, and so on). Three main options can be changed for each survey result through different dropdown boxes: the presentation format, results order, and calculation type. Each is explained in the relevant sections below.

Hovering the mouse over a survey result chart can trigger up to three sources of information. Firstly, it can present a quick view of information regarding the graph (such as the exact numbers involved in determining a percentage shown in a pie chart). Secondly, it can trigger a camera icon to appear - it's possible to download the chart as a .png image file by clicking on this icon. Thirdly, it can prompt image editing options to appear - these are explained in the image editing section below.

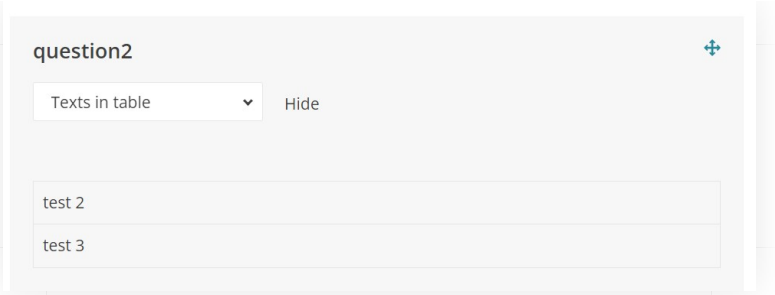

Presentation Format

The screenshot below shows sample results from a question utilizing a text box, wherein the answers are presented as a word cloud. The display type can be changed by clicking on the first dropdown box in the top left. This will provide you with options for presenting the data in a different format.

These results can also be presented as "texts in the table" which appears below:

We recommend exploring the options for each type of question to determine which is best suited for your needs.

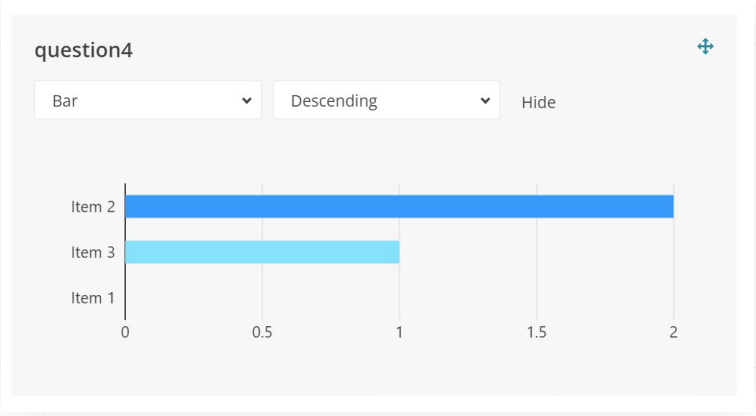

Results Order

In some cases, it may also be possible to display the order of the results within the chart. The example below shows a bar chart, with the options to display the order of the results in "Default Order", "Ascending", or "Descending". "Default Order" means that the answer options will be presented in the order that they were presented with (answer option 1 is therefore first, answer option 2 is second, and so on). "Ascending" means that the data will be displayed with the least selected answer first, and the most selected answer last - "Descending" mirrors that order, with the most selected answer first, and so on.

Calculation Type

A third dropdown box option is also sometimes available, depending on the survey question type. This relates to the calculation of the data, before the presentation type. In the example below, it's possible to choose between a histogram or an average of the data. While the presentation format adjusts, it is the underlying data that is responsible for that, rather than the presentation format per se.

Overall we would recommend exploring the options available for each type of survey result and making an evaluation based on the data and your needs for which result format would be best.

Image editing

For histograms, bar charts, and scatter plots, hovering the mouse cursor over a survey result prompts the appearance of several image editing options.

Each of the items is explained below:

Zoom: Selecting this turns the cursor into a cross - it's then possible to click and drag over a region of the graph, to zoom in on a particular part of the image.

Pan: Selecting this icon allows for clicking and moving the graph within the image frame. You can then move the view of the graph to only show regions of interest. This can be used with the zoom function to inspect a particular region of the graph.

Box select: This icon allows you to highlight parts of the graph (such as a particular bar in a bar chart) by clicking and dragging a box shape over the region you wish to select.

Lasso select: This icon works similarly to the box select icon in that it allows you to highlight parts of the graph (such as a particular bar in a bar chart) by clicking and dragging, yet the shape used for the selection is free-form.

Zoom in: Zoom in on the image. Can be used with the pan.

Zoom out: Zoom out of the image. Can also be used with the pan.

Autoscale: Automatically determines the best view dependent on the axes.

Reset axes: Resets the axes to their original position. Essentially works the same as autoscale.

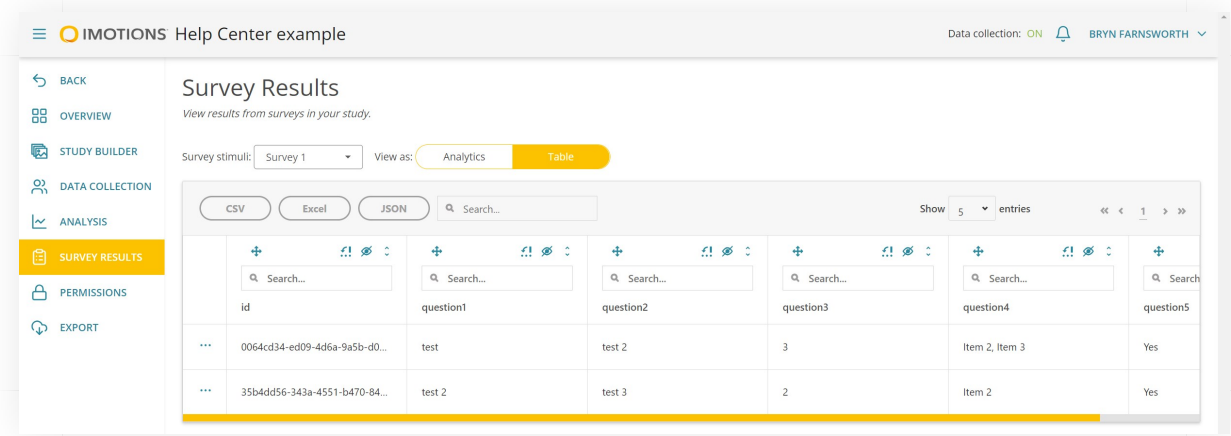

Download the plot as a png: This will immediately download the current view of the plot as a .png file.

Table

The table view presents several detailed options for exploring the raw data collected from the survey.

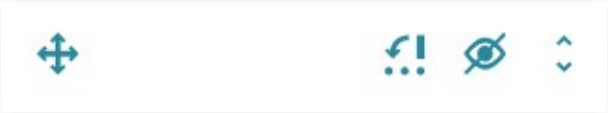

Select survey: If you have deployed more than one survey in your study, you can select which one should appear by selecting the relevant survey name from the "survey stimuli" dropdown box.

Download data: Below this, you can select to download the survey data in one of three formats: .csv, .xlsx (Excel), or .json.

Search: Next to these download options, you can search the survey by answer. For example, searching "Item 3" will result in only the first row being shown in the image above, as that was the only participant that had answered "Item 3". This can also be repeated in the search bars above each question, for each specific question. This does not impact the downloaded data.

Column options: There are several icons at the top of each column (as shown in the image below). Each enables a different function for displaying the data.

The left-most icon allows for clicking and dragging of the column for re-arranging the order of the data. This change will be reflected in the data when it is downloaded.

The next icon ("Move to Detail"), once clicked, will move the column out of view to a "minor" column. This column will then not be included in any downloaded data. The column data can be viewed by clicking on the three dots to the left of each row. That data can then be re-inserted into view by clicking on "show as column".

The next "eye" icon ("Hide column") will hide the selected column from view. As with the "Move to Detail" option, this column will then not be included in any downloaded data. A dropdown box, next to the central search bar, will appear if this is selected. Any hidden columns will be listed here and can be selected to appear in the data once more.

The right-most up and down arrows ("Ascending / Descending") determines whether the data will be sorted in ascending or descending order. This will not affect the ordering of the data when downloaded.
