Export: Create EDF files from Sensor Data Export Files

Some analytical tools such as Acqknowledge require data to be in a .edf format

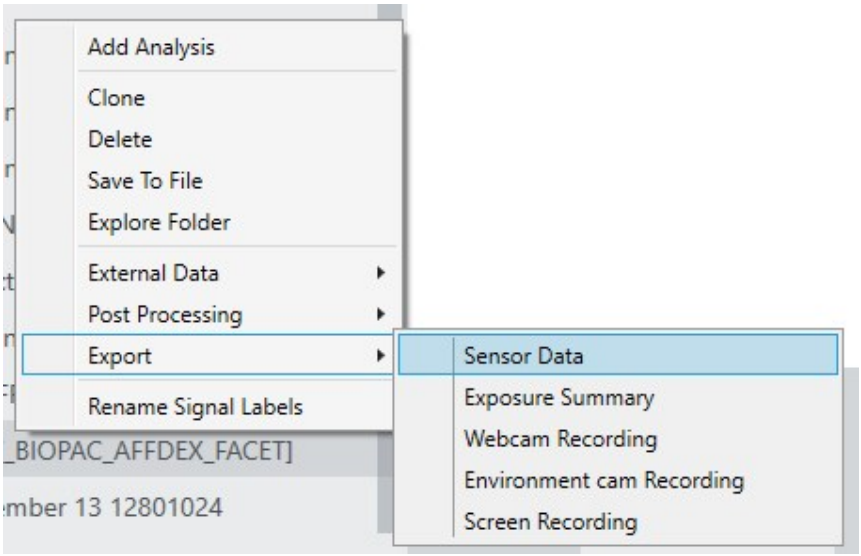

In this article we provide a tool and instructions for converting .txt files that are exported from iMotions into .edf format files.

Requirements:

- Microsoft Excel
- The .edf executable file and .json files available here
- Command Prompt

1. Export Raw Sensor Data:

First, you will need to export the sensor data you are interested in analyzing. In this article, we will review how to do this for BioPac data, but the format will follow for any data you are interested in converting.

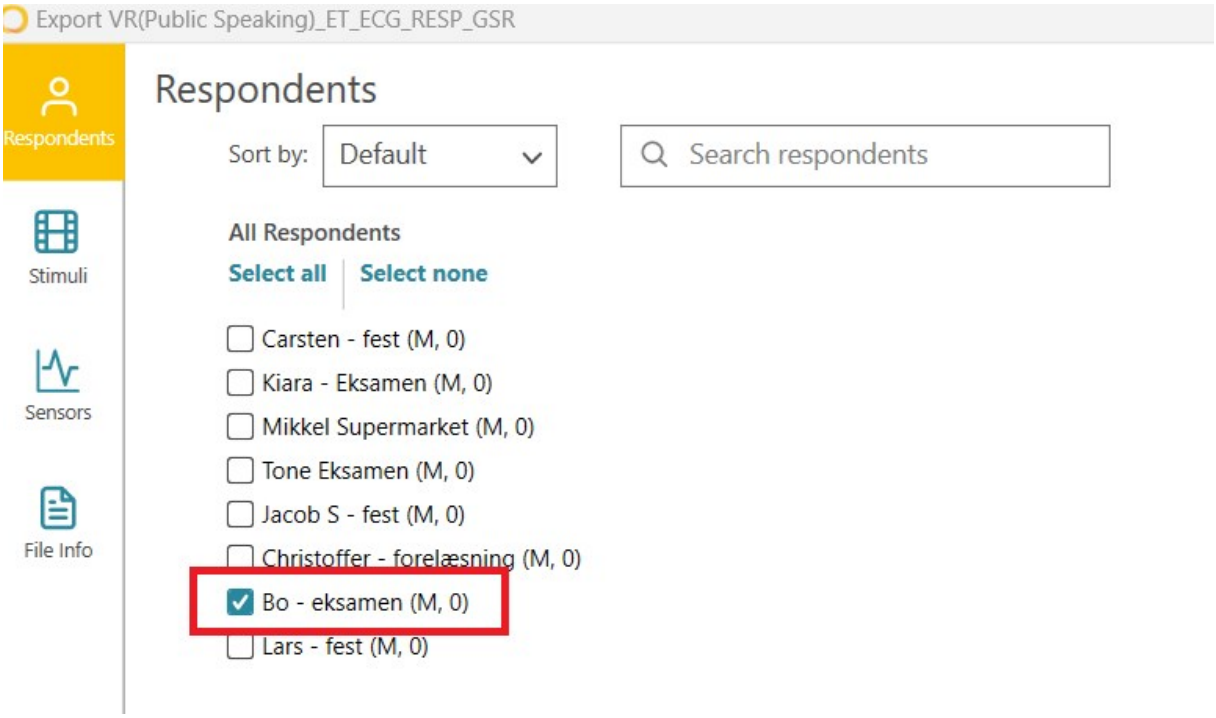

Be sure to select the signals of choice from the export menu - in this case BioPac.

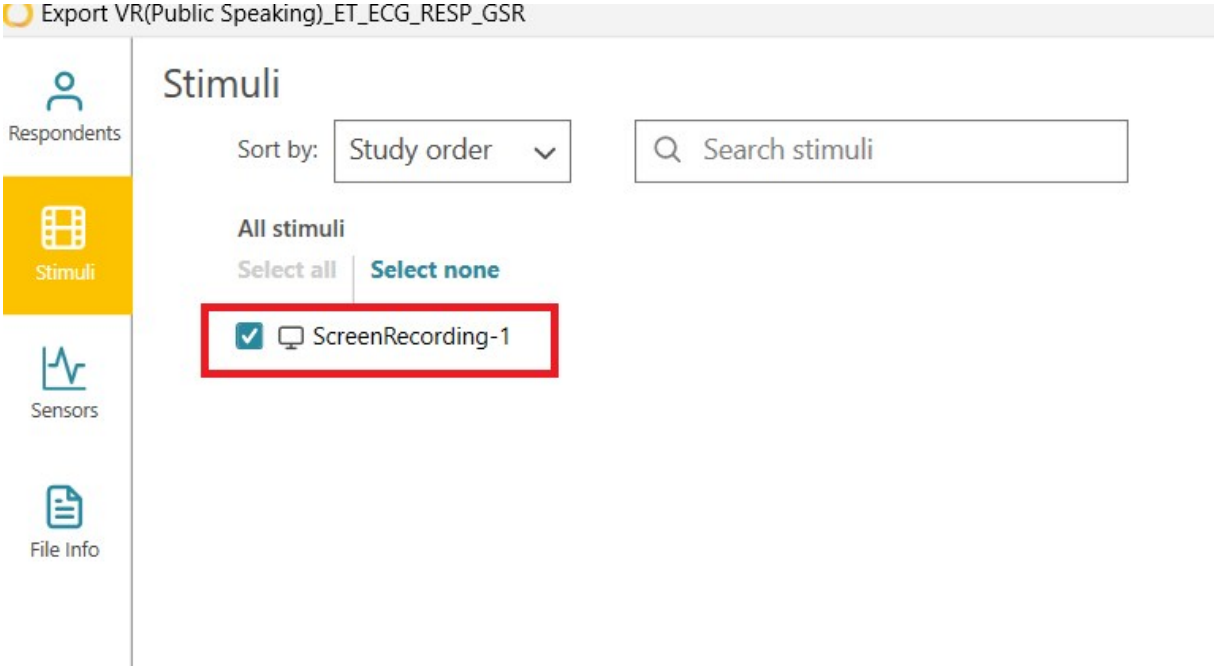

Make sure you have set / selected the following options:

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

- Relevant respondents

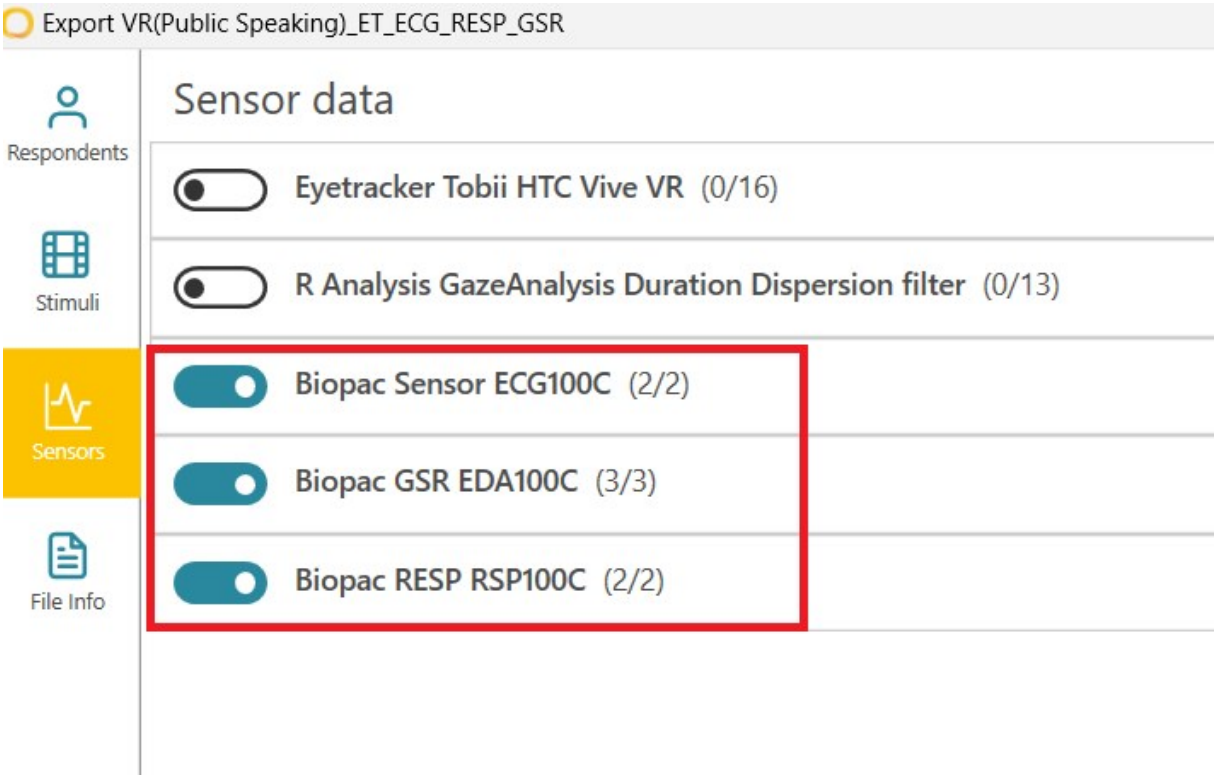

- Relevant stimuli

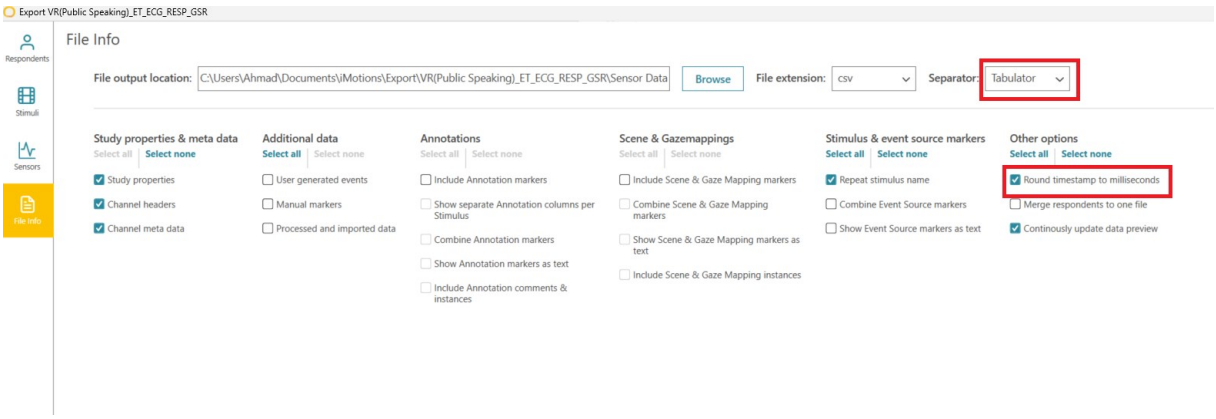

- Choose Biopac sensors

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

- Make sure to check "Tabular" format and "Round timestamp to miliseconds" off

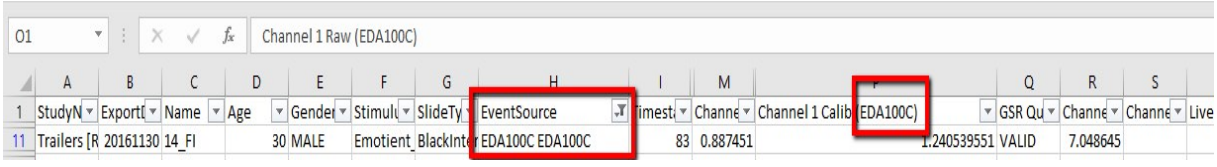

- Press export

2. Setting up the .json files

Next you will need to properly set up the .json files associated with the data you would like to process. In this example we are modifying the biopac.json file.

To do this, open one of the data files that you just exported and look for the event source and signal label for the data of interest:

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

In this example, to look at GSR data for BioPac, the event source name EDA100C EDA100C is and the signal label name is Channel 1 Calib(EDA100C)

Open the appropriate .json file in a text editing tool such as notepad.

Modify the event source and signal name labels accordingly. In the example below, I have replaced the default names with the source names for this specific file

Default file:

Updated file:

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

Note that in the column for event source data, you will see instances of multiple event source streams. Please be sure to select just the event source you are interested in - i.e. if you see EDA100C EDA100C|ECG100C ECG100C, only copy "EDA100C EDA100C" into your .json file

Save and close the file.

3. Running the converter

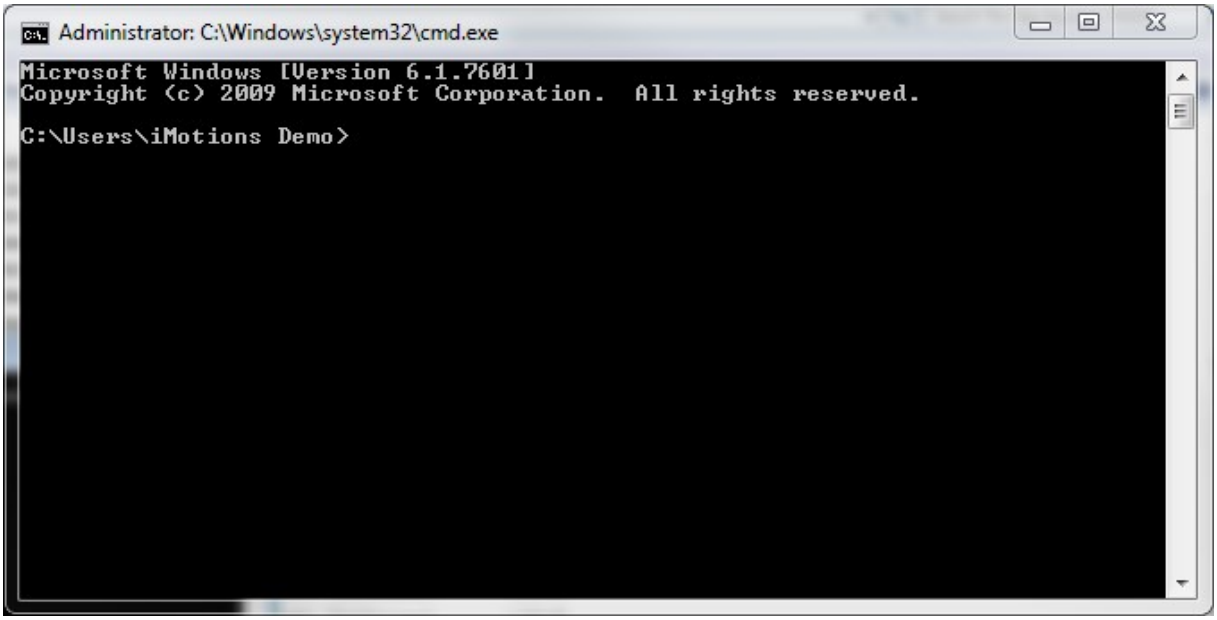

Copy the .txt files exported from iMotions to the same folder that the toedf.exe file is located

Open Command Prompt in Windows:

To access the command prompt window, you click on the following path:

Click on the Start button Start > All Programs > Accessories > Command Prompt

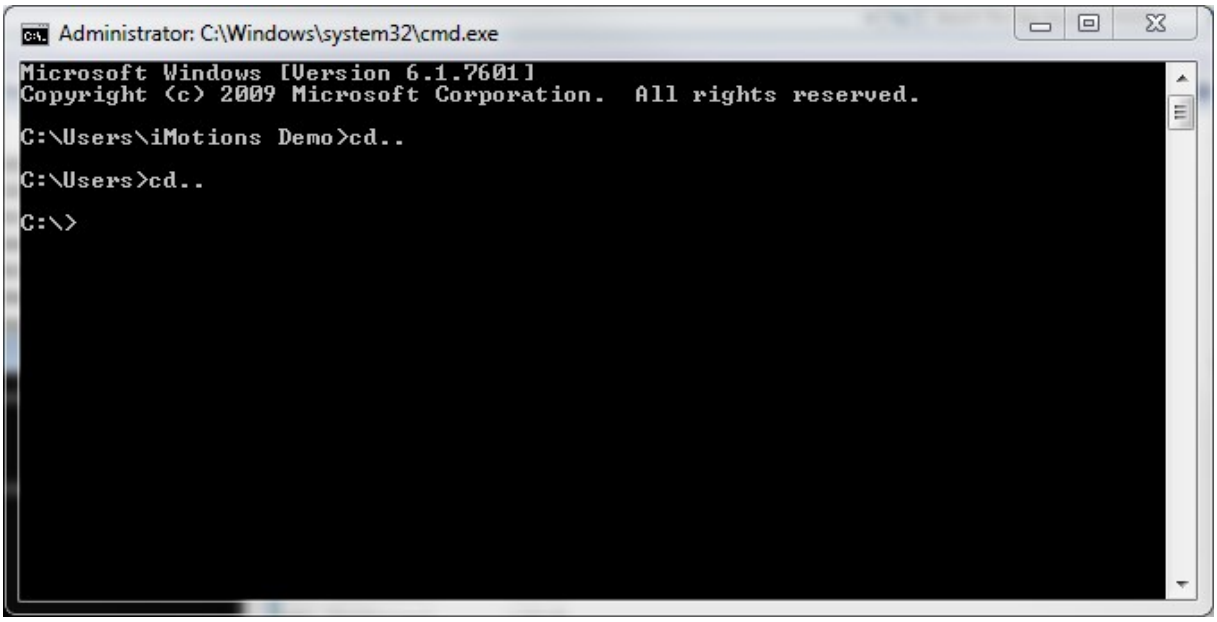

You should then see this window:

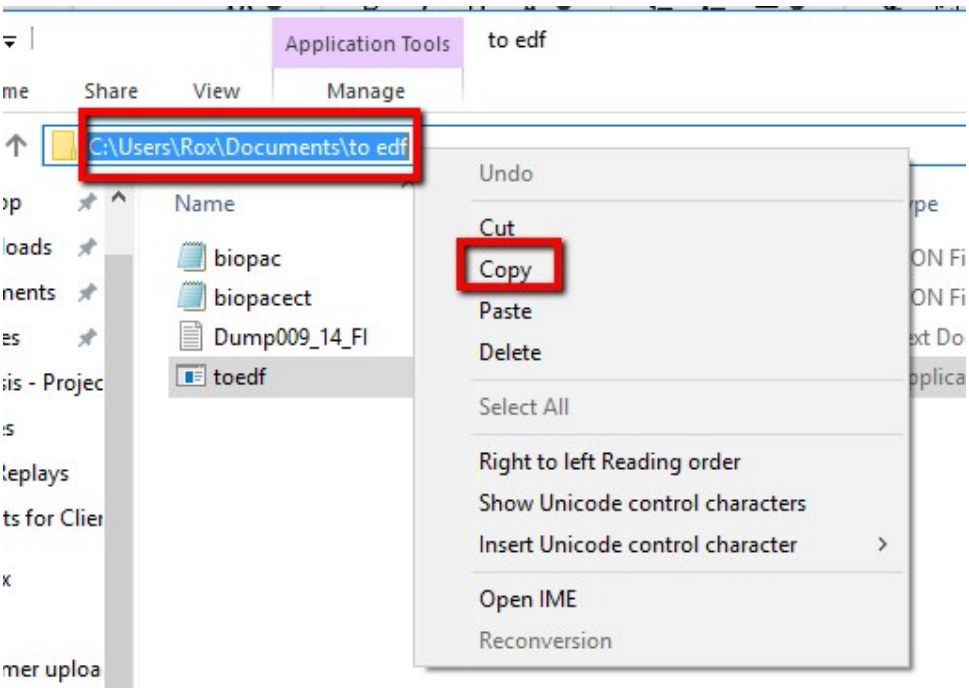

Note: the line "C:\Users\iMotions Demo\>" will be different for your computer

Once you are in the command prompt, type "cd.." and press enter. Repeat this step until the command line is only "C:/>" as the image below shows:

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

Next, go to the folder where all of your datasets are, and copy the address where these files are:

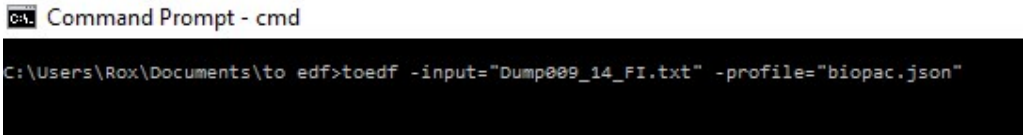

Paste this path in your command prompt window and click enter.

Then type in the following into the command prompt, replacing the "filename" with your specific file name and the .json file name with the one you updated and saved in the previous step:

toedf -input="filename.txt" -profile="biopac.json"

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

Press enter when you are done. This will create the following new directory structure in the same folder where the toedf file is stored:

STUDYNAME\RESPONDENTNAME\STIMULI_X.EDF

Note that there will be separate files for each stimulus

You can also choose to convert the entire sensor export file to one edf file (including interslides) by pasting the following text into command prompt (remember to replace filename with your filename and the .json with the file you created earlier):

toedf -input="filename.txt" -profile="biopac.json" -singlefile=true

If you choose to do this, the following directory structure will be created:

STUDYNAME\RESPONDENTNAME\ALL.EDF

Note that these files are now in the .edf format and can be read into the appropriate post-processing system of your choice.
