Export: R Processed Respondent Statistics

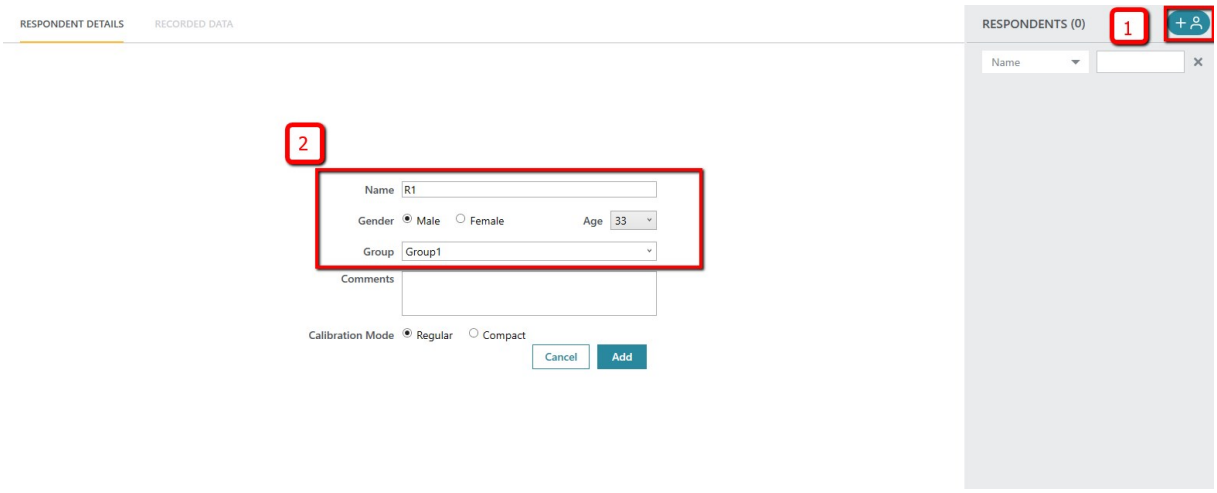

The R-notebook is called: Respondent Statistics. It produces file exports for respondents statistics under the created analysis.

1. Prerequisites

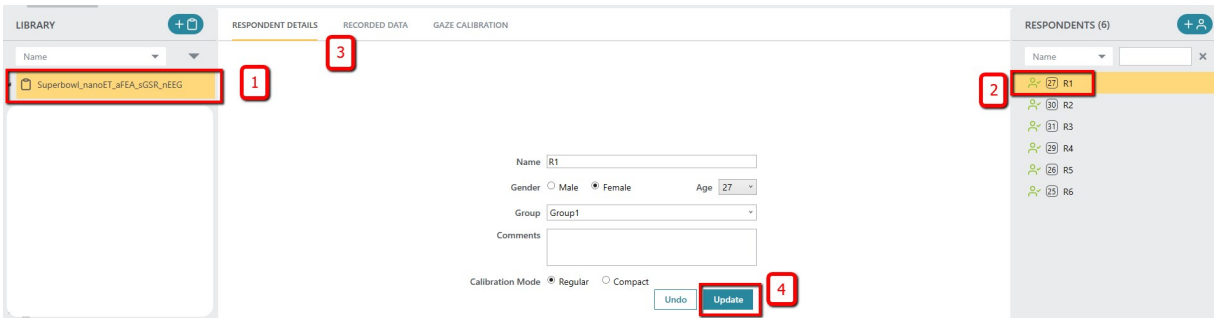

Supported iMotions version: iMotions 8.1.4 and later

2. How to Specify Information of Respondents

You can specify Name, Gender, Age, Group of the respondent when you create a respondent in iMotions. These four types of information will be able to be exported later.

You can also update respondent information even after you have collected data for that respondent: click on your study -> click on the respondent name -> click on "RESPONDENT DETAILS" -> then "Update" once you finish the update.

3. How to Export in iMotions Desktop

To export respondents statistics under your created analysis, the following steps need to be followed:

1. Create a new analysis to include the respondents for which you wish to export the statistics:

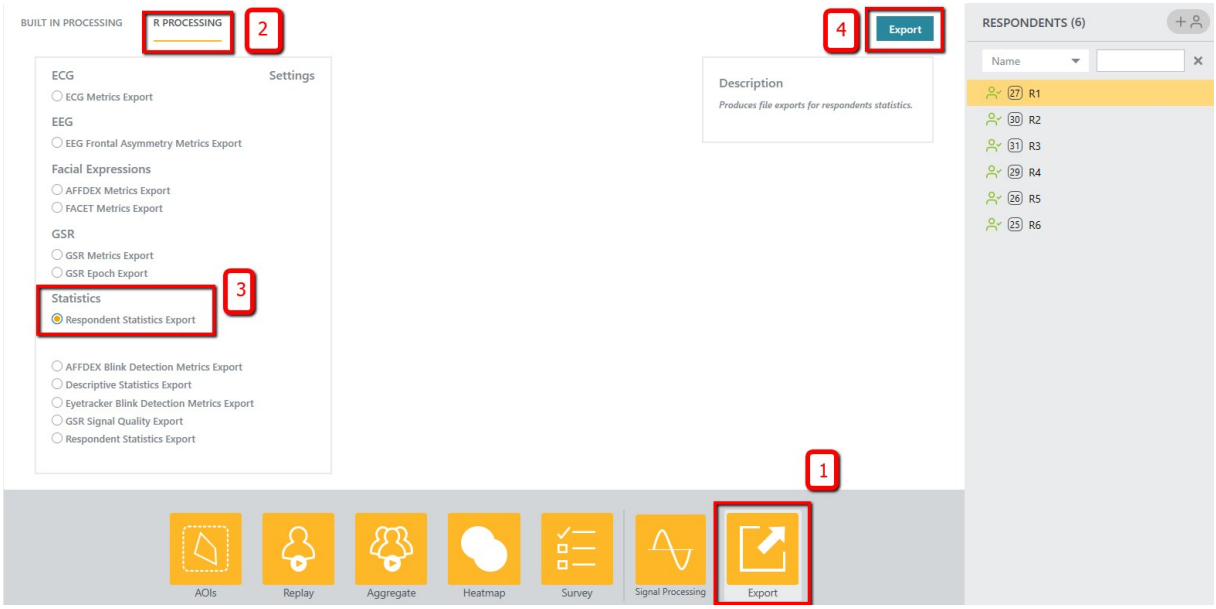

2. Advance through the steps "Segmentation settings" and "Segmentation criteria" with your preferred selections of respondents to be included in your analysis. Tips: You can right click your mouse under RESPONDENTS panel to *Select all* or *Deselect all*.

3. After clicking Next, you reach the step "Signal processing". Please note that you *don't* need to add any notebook in this step in order to export respondent statistics, it is built in iMotions already. However, you are free to add any other notebook for your other analysis purposes. The same applies to the next step: "Select Stimuli". However, in this step, you have to select at least one stimulus, otherwise, iMotions will throw a warning saying: At least one stimulus needs to be selected for analysis.

4. You can access the exported file under your created analysis by (1) clicking on the 'Export' button, (2) under 'R PROCESSING', you can (3) click on 'Respondent Statistics Export', and then (4) click on 'Export' button to generate the file in .txt format.

4. Outputs: Exported file

The generated file is composed of two parts: summary statistics of all the exported respondents and information of each individual respondent. All the information is based on what has been specified in iMotions. Please see part 2 regarding How to Specify Information of Respondents.

For the summary statistics part: count number, average age, median age, standard deviation age has been calculated based on grouping variables: Group and Gender.

For individual respondent information, Name, Age, Gender and Group will be given.

Please see an example export file in the attachment.

STUDY NAME: Superbowl												
ANALYSIS NAME: respondents info export												
SUMMARY STATISTICS												
Group	Group1	Group1	Group1	Group1	Group2	Group2	Group2	Group2	All Groups	All Groups	All Groups	All Groups
Summary Statistics	Count	Average Age	Median Age	Std. Dev Age	Count	Average Age	Median Age	Std. Dev Age	Count	Average Age	Median Age	Std. Dev Age
Male	1	30	30	NA	1	31	31	NA	2	30.5	30.5	0.71
