# Export: Signal Processed Data

*This help center article explains how to retrieve the different types of R-processed data.*

## What is 'R-processed' data?

The different R-Notebooks produce different types of new data: 'R-processed data'. Depending on the specific R-Notebooks, this includes (1) additional R-processed data channels in the Replay, (2) additional R-processed data channels that can be exported as part of the sensor data export, (3) new R-processed 'metrics' export files and/or (4) a report (with a step-by-step explanation of the method used as well as the R-code itself).

Below, we explain step-by-step how to retrieve these different types of data. Note that more information can be found in the help center articles dedicated to specific R-Notebooks; this help center article intends to provide a general overview.

## How to export the different types of 'R-processed' data

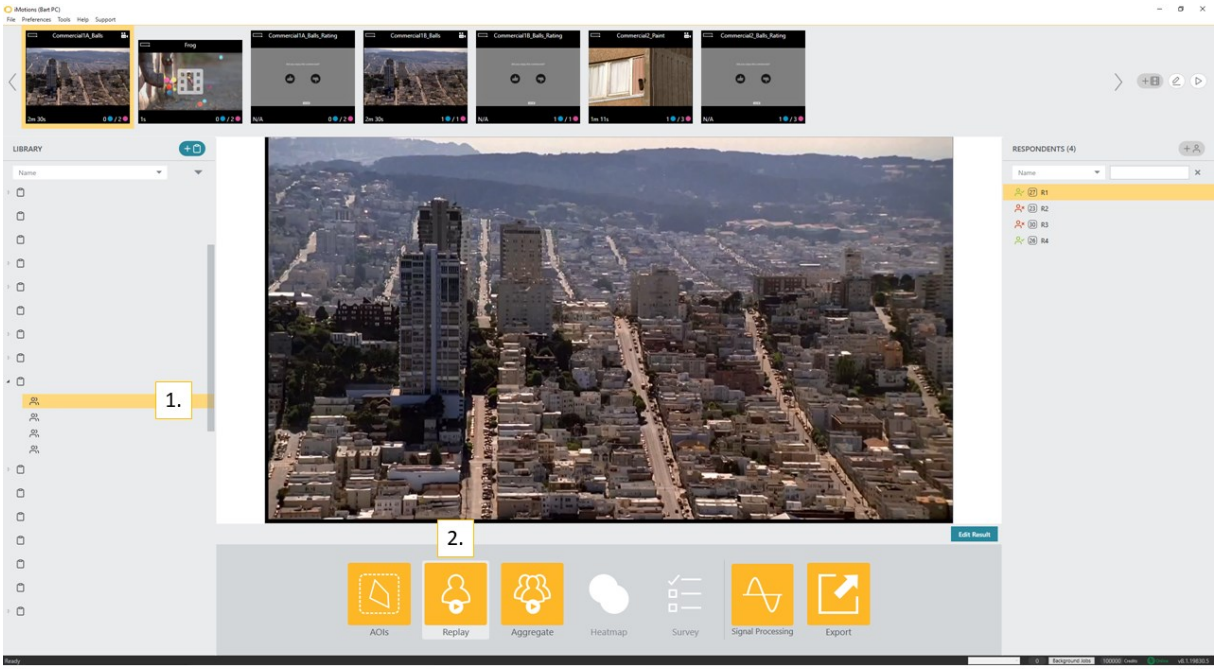

### Replay

Many R-Notebooks contribute new sections of data to the Replay; this could be timeline data or metric data For example, the GSR peak detection R-Notebook produces two such sections: 'GSR peaks' (timeline data) and 'GSR metrics' (metric data).

- The section 'GSR peaks' contains eight R-processed data channels, among which an interpolated data channel ('GSR interpolated', i.e. with missing values interpolated), a tonic signal ('Tonic signal', i.e. the fast fluctuations in the electrodermal activity are filtered away), a phasic signal ('Phasic signal', i.e. the slow fluctuations in the electrodermal activity are filtered away) and a binary signal which marks the individual arousal peaks ('Peak detected (Binary)'). This is 'timeline' data, which means that the data channels can be visualized on the timeline.

- The section 'GSR metrics' contains three R-processed metrics, summarizing the GSR peaks for the respondent and stimulus currently displayed in the Replay. The total number of peaks ('Peak count'), the peak rate ('Peaks per minute') and the average amplitude of the detected peaks ('Average peak amplitude'). Note that, in the Replay, these are metrics that apply to the *entire* stimulus duration.

To open the Replay (yellow path):

1. Click the name of the analysis in the Library
2. Click the ‘Replay’ button in the analysis bar

To retrieve the R-processed data in the Replay (yellow path):

1. Navigate to the page 'Signals'
2. Find the section 'GSR peaks' and click on the small 'arrow' button to expand it. Then, click on the data channels of interest to visualize them on the timeline
3. Find the section 'GSR metrics' and click 'Show'

## Export: Metrics

The R-Notebooks also produce export files (.csv), which, for *every* respondent included in the analysis and for *every* stimulus, scene, or annotation present in the study (not only for the entire stimulus duration as in the Replay), list all R-processed metrics.

The R-processed ‘metrics’ are exported from the ‘Export’ menu in the analysis.

To export R-processed metrics:

1. Click the name of the analysis in the Library
2. Click the ‘Export’ button in the analysis bar
3. Navigate to the page ‘R-processing’
4. Select if you want to export one file per metric (Individual metrics export), fx. one file containing GSR peaks and one file containing Facial expression metrics ) or if you want to merge different metrics into one file (Single multimodal export). This feature is available from iMotions 9.1
5. Select the R-processed export file of interest by toggling the button.

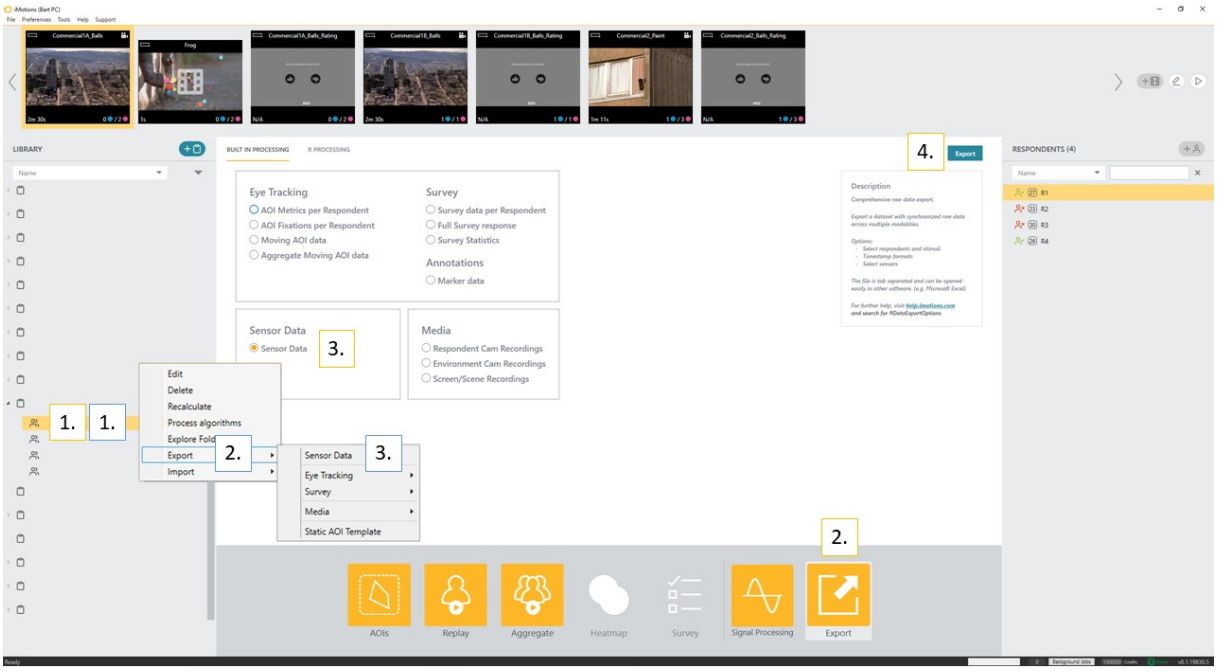

Confidential © 2023 Redistribution is not permitted without written permission from iMotions

6. Change the settings of your export if needed
7. Click the blue ‘Export’ button in the top-right corner, and click 'OK' for saving to the default folder

If you now explore the folder, you should find a .txt files with the R-processed metrics.

## Export: Sensor data

The R-processed timeline data, on the other hand, can be exported as part of the sensor data export files (.csv). This is done by ticking the option: ‘Processed and imported data’ in the sensor data export editor.

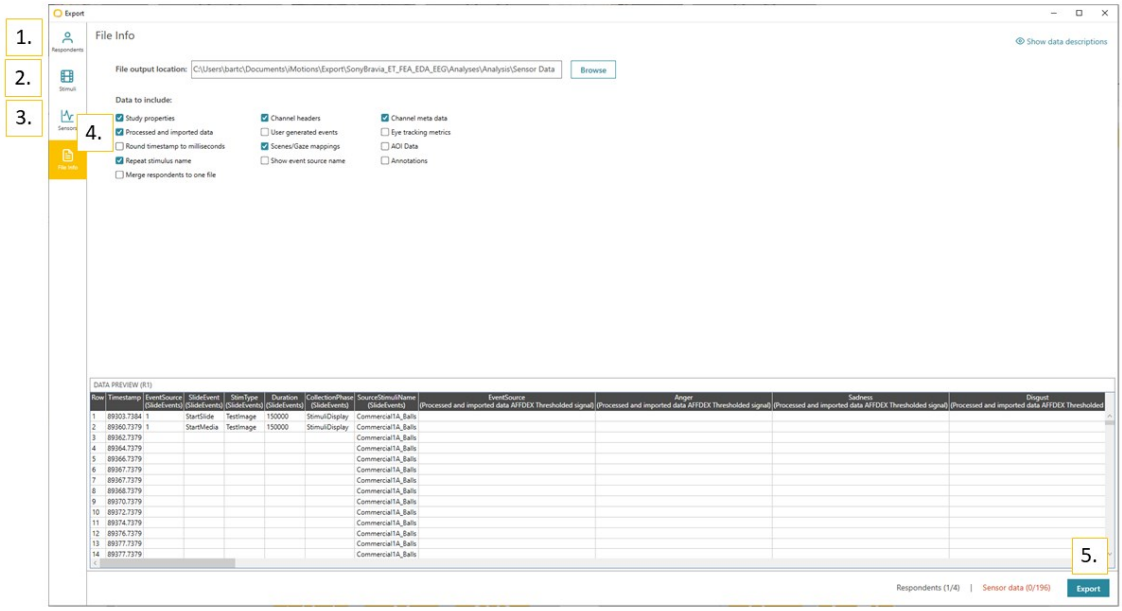

To open the sensor data export editor (yellow path):

1. Click the name of the analysis in the Library
2. Click the ‘Export’ button in the analysis bar
3. Select the option ‘Sensor data’
4. Click the blue ‘Export’ button in the top-right corner

Alternatively (blue path):

1. Right-click the name of the *study*/*analysis* in the Library
2. In this right-click menu, click ‘Export’.
3. Then, click ‘Sensor data’.

To export the R-processed data from the sensor data export editor (yellow path):

1. Select at least one respondent in the tab ‘Respondents’
2. Select at least one stimulus in the tab ‘Stimuli’
3. If relevant: include (raw) sensor data in the tab ‘Sensors’ (Not necessary for exporting R-processed data)
4. Select the option ‘processed and imported data’ in the tab ‘File info’
5. Click ‘Export’

If you now explore the folder, you should find a .csv file for every respondent selected in the sensor data export editor, containing the R-processed data.
