In-Store Shopper Report

March 2020

Background & Objectives

Sensodyne

Sensodyne is a leading brand of oral care products intended for individuals with sensitive teeth. As part of their marketing strategy, they have created new point-of-sale materials (POSM) to be displayed on the shelf. Sensodyne would like to understand how the new POSM impacts shoppers' experience at-shelf, and how that experience is different from cases where the POSM is **not** present.

1

How does the presence of POSM direct shoppers' visual attention at-shelf?

2

Does the presence of POSM help drive notice of Sensodyne products?

3

How do shopper visually consume the POSM itself while at-shelf?

Modalities

Eye Tracking Glasses (ET)

Measuring visual attention towards elements in the natural environment

- What products and packages capture visual attention?
- Do participants spend time looking at key elements of the products?
- What is the navigation path users take through the store and shelf?

Survey

Measuring stated responses to questions related to the stimuli

- What do participants remember from the experience?
- What packages/products do participants report stood out from the experience?

Study Details

Stimuli Tested: Two Shelf Layouts

POSM

No POSM

Study Specifications

Demographics

- $N=15$
- Ages: 18-59
- 8 Male, 7 Female
- Regular purchasers of dental products
- Location: Copenhagen, Denmark

Methodology

Eye Tracking Glasses

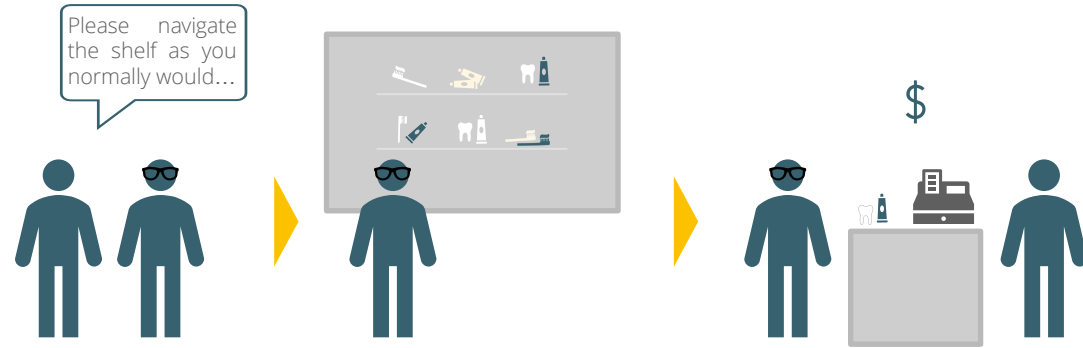

Study Flow

Setup & Calibration

Participants are outfitted with eye tracking glasses to capture visual attention while naturally browsing a store.

Shopping Experience

Participants were instructed to explore the oral care shelf as if they were naturally shopping for oral care products, and then to purchase a product. After the purchase was completed, the glasses were removed and participants were able to ask any questions they had about the experience.

Methodology

Applied Virtual Reality

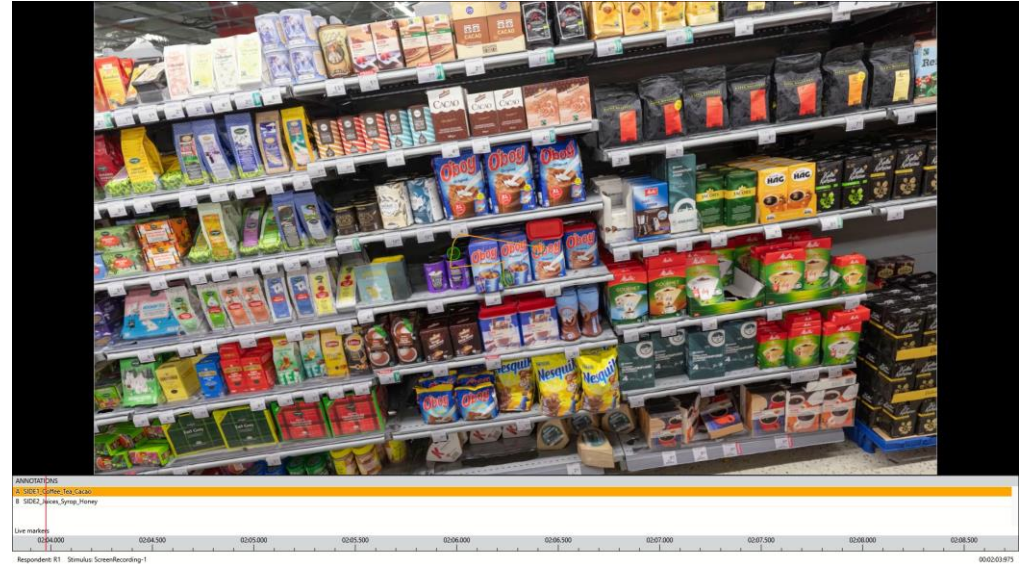

Virtual Reality

In-Store Shopper

The in-store shopper methodology can also be successfully applied to virtual reality shopping experiences, using a VR headset. An example from our demo study is displayed to the right.

Participant Replay Video

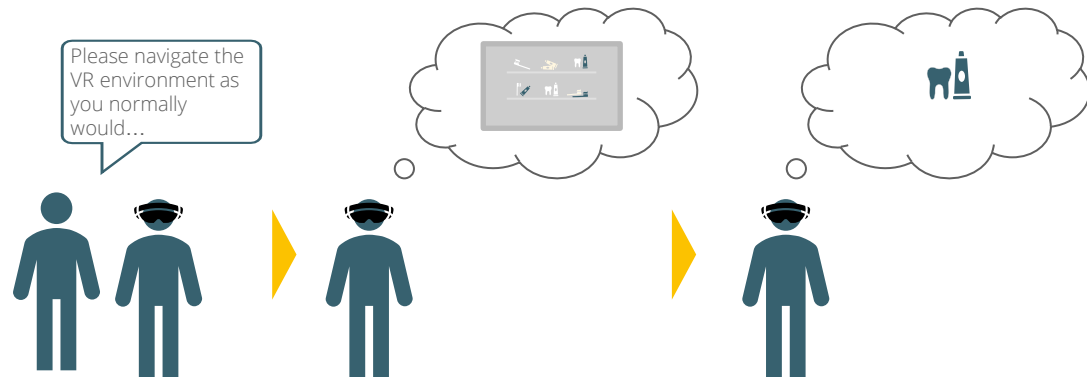

Study Flow (VR)

Setup & Calibration

Participants are outfitted with a VR headset calibrated to capture visual attention while naturally browsing a virtual environment.

Virtual Shopping Experience

Participants are instructed to explore the virtual reality environment oral care shelf as if they were naturally shopping for oral care products and choose a product they would purchase. After the experience is completed, the VR headset is removed and participants are able to ask any questions they had about the experience.

Neuro Measures

Explained

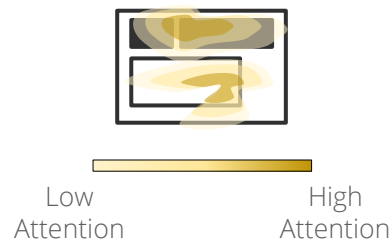

Eye Tracking (ET)

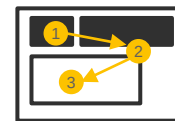

- Eye tracking **heat maps** are color-coded visualizations of where consumers are looking at a given point in time.
- **Visual attention** is aggregated across the entire consumer base, and displayed as “heat” overlaid on a stimulus.
- This heat can help identify what areas of the shelf layout draw the most visual attention, and what areas or elements may go missed entirely.
- **Areas of interest** can be identified to determine how quickly specific elements are noticed/which go missed and how long people spend on different elements.
- **Navigation paths** outline, on average, the visual navigation of the consumers through the shelf.

Deliverables

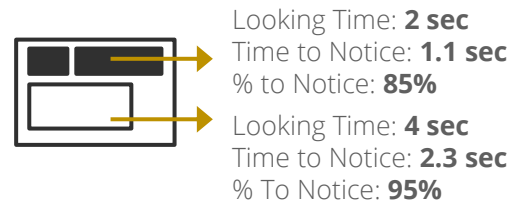

Heat Maps

Navigation Paths

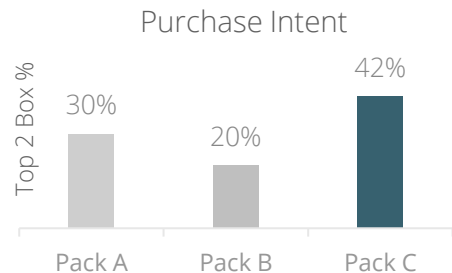

Areas of Interest

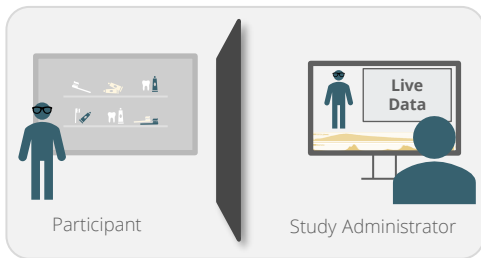

Self Report

- Self report measures **consumers' stated responses** pertaining to a stimulus or experience.
- While biometrics measure bodily and cognitive responses in the moment, self-report measures respondents' **subjective** experience **after the fact**, allowing them to elaborate on why they believe they responded to a stimulus the way they did.
- In shopper testing, researchers may follow up the experience with a written survey pertaining to intent to purchase, likeability, and recall.
- Some researchers also conduct **biometrically informed interviews**. In this scenario, researchers observe live signals while the participant is undergoing the shopping experience. After, the administrator probes the participant with specific questions pertaining to their experience.

Watch Live Signals, Probe After

Executive Summary

POSM Drives Rapid Notice of the Product Better Than No POSM

With POSM, shoppers are drawn to Sensodyne products first, whereas with no POSM, competitor products better grab immediate attention.

At POSM Shelf, Shoppers Also Spend Less Time with Competitor Products

Shoppers spend almost 25% less time looking at competitor products when POSM is included for Sensodyne on the shelf.

POSM May Create “Halo Effect” for Sensodyne Brand

POSM creates a more optimal path to Sensodyne products, and reinforcement of the brand may allow for stronger connection between brand and consumers.

Shoppers Visually Explore Entirety of Wing POSM

Even though it is not the first thing noticed in all shoppers' experiences, 100% of shoppers explore all main elements of the Sensodyne Wing.

Product Imagery on Wing May Detract from Key Messaging

The product image on the wing receives the most time spent compared to text messaging, suggesting messaging may not be read completely by all shoppers.

Presence of POSM May Prime Attention To Sensodyne

When navigating the POSM shelf, attention is first directed towards Sensodyne products. With no POSM, shoppers are drawn to competitor products first. POSM may be priming shoppers to focus on the advertised brand.

POSM Drives Attention Away From Competitor Products

With POSM for Sensodyne, consumers end up spending almost 25% less time looking at competitor products.

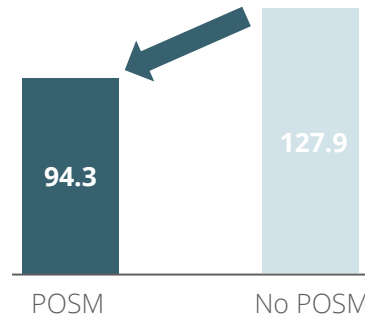

POSM

No POSM

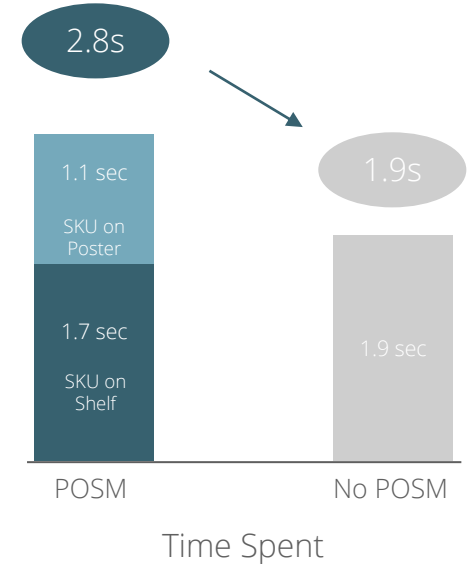

Time Spent on
Competitor Products (s)

As a result of POSM marketing, shoppers spend less time focusing on Competitor products when their attention is initially focused on Sensodyne

POSM Creates Greater Opportunity for Brand Connection

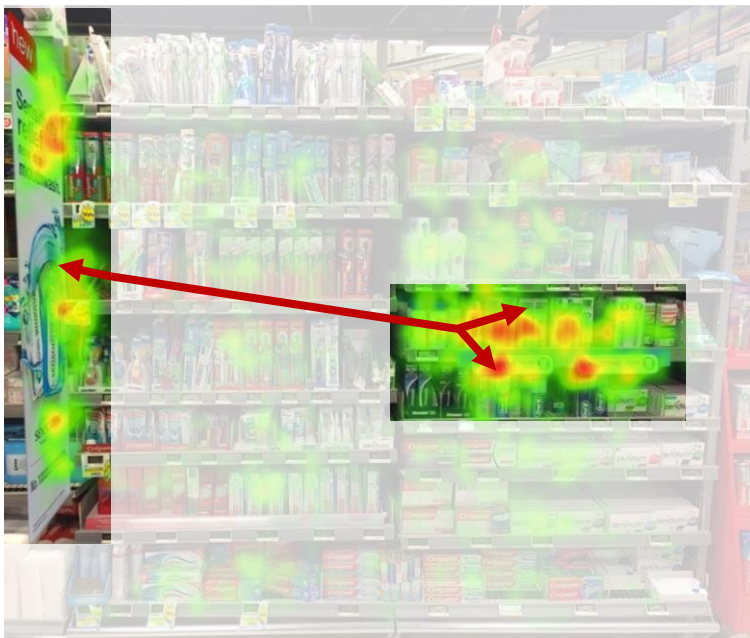

Although time spent looking at Sensodyne *products* does not differ with or without POSM, the POSM primes shoppers to spend more time with Sensodyne materials overall, which may foster an immediate connection with the brand.

POSM Creates Greater Opportunity for Brand Connection

The POSM creates a more optimal path to the product, allowing the brand to be reinforced (brand sign + product) which may lead to a stronger connection between shoppers and the brand.

POSM

No POSM

Cognitive Insight

Congruent elements can impact cognitive processing, allowing the supported information to become more salient.

By priming the shelf with POSM signs for Sensodyne, shoppers begin by looking for the Sensodyne products. Combining these actions may reinforce the brand and make stronger connection with shoppers in the moment.

All Elements of the Design Gain Shopper Attention

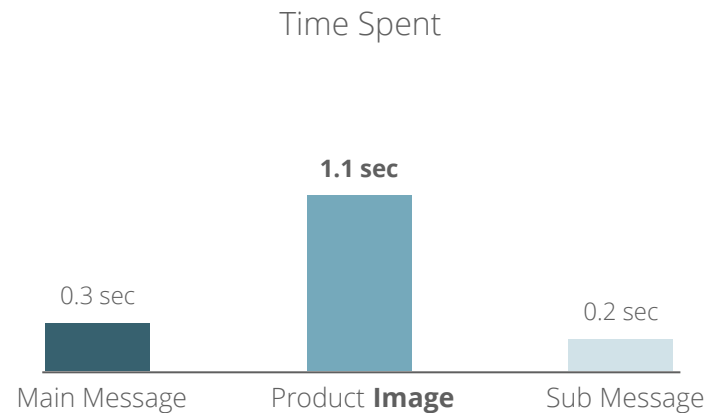

Although the POSM Wing may not capture the earliest attention, it does capture every shopper's attention. Not only do all shoppers visually attend to the wing, but they also explore each of the key elements*.

*Note that these stats are calculated in the context of the shelf, hence the relative long times to first notice.

Although Attention is Achieved, Limited Time Spent Suggests Messaging May Not be Read Completely

The product image is simple and eye-catching to capture early and long attention.

Conclusions

1

POSM is an Effective Marketing Technique to Drive Attention to Brands

In this shopping experience, POSM proves to be an effective technique to grab attention of shoppers, and drive visual notice of the targeted brand over other competitive brands. Additionally, POSM for Sensodyne results in shoppers spending less time with other competitor packages.

2

Without POSM, Competitor Packages Stand Out Over Sensodyne

When POSM is not present, competitor packages are noticed sooner than Sensodyne. Sensodyne's packaging itself may not drive attention as effectively.

3

Messaging May Go Missed on Wing Because of Size and Placement of Text

Although shoppers notice and spend time on the Sensodyne wing, most of the time spent is with the image of the product, which is larger and more central than all of the text messaging. To emphasize messaging, design of the wing should be optimized in text size and placement to draw attention to text.

Thank You!
